

Fundamental Entities Architrinos

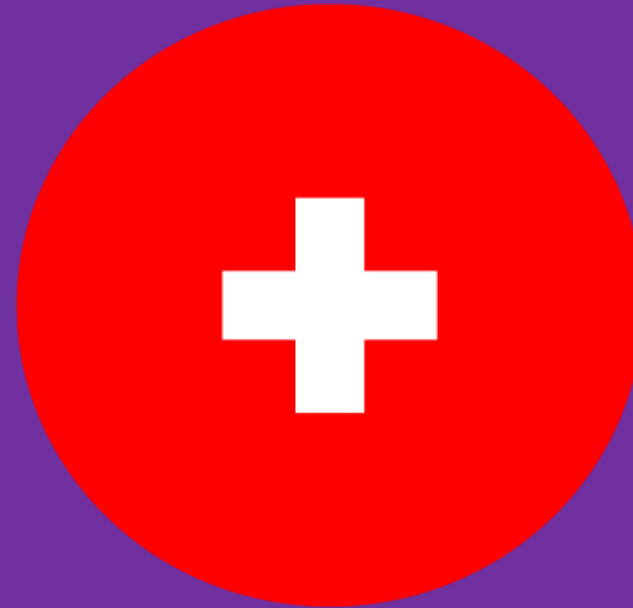

Architrinos Are Fundamental

Absolute time, Euclidean space, causal wake emitters

Euclidean
Space

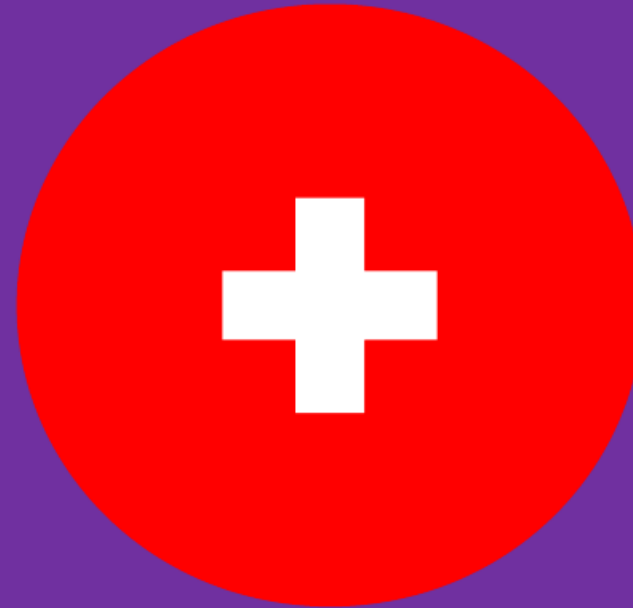

Architrino Polarity Unit

Equal and opposite polarity units:
 $|q| = |e|/6$

Pair production and annihilation are assembly-level descriptions

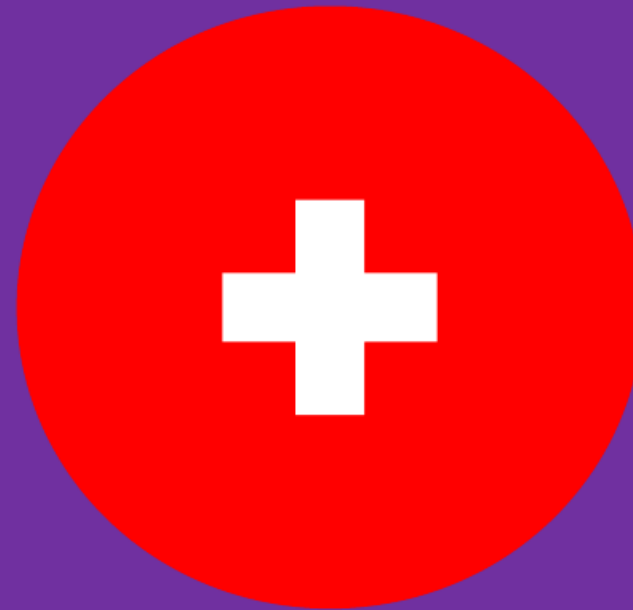

Causal Wakes Change Motion

**Architrinos continuously emit potential-bearing causal wakes.
Energy tracks the motion changes caused by received wakes.**

Wake Strength = $1/r^2 \times W$

Case	Branch factor W	At $r > 0$
source at rest	$W = 1$	$ q /(4\pi r^2)$
moving source	$W = D_t/D_s $	$ q W/(4\pi r^2)$

Point Transceivers Create a Dynamical Geometry

- An architrino state is (polarity, time, position, velocity): (σ , t , s , s').
- Like polarities repel. Opposite polarities attract.
- The total polarity inventory of the universe is zero.
- Each architrino carries a path history up to the present time.
- Received action comes from causal wake surfaces that intersect the architrino now.
- For $v < c_f$, the architrino remains inside its emitted wake fronts.
- For $v > c_f$, its path can move outside earlier wake fronts.
- Self-action requires same-source wake intersections, not speed alone.
- Emitter and receiver velocity set the received action at each wake crossing.
