

The World We Recover

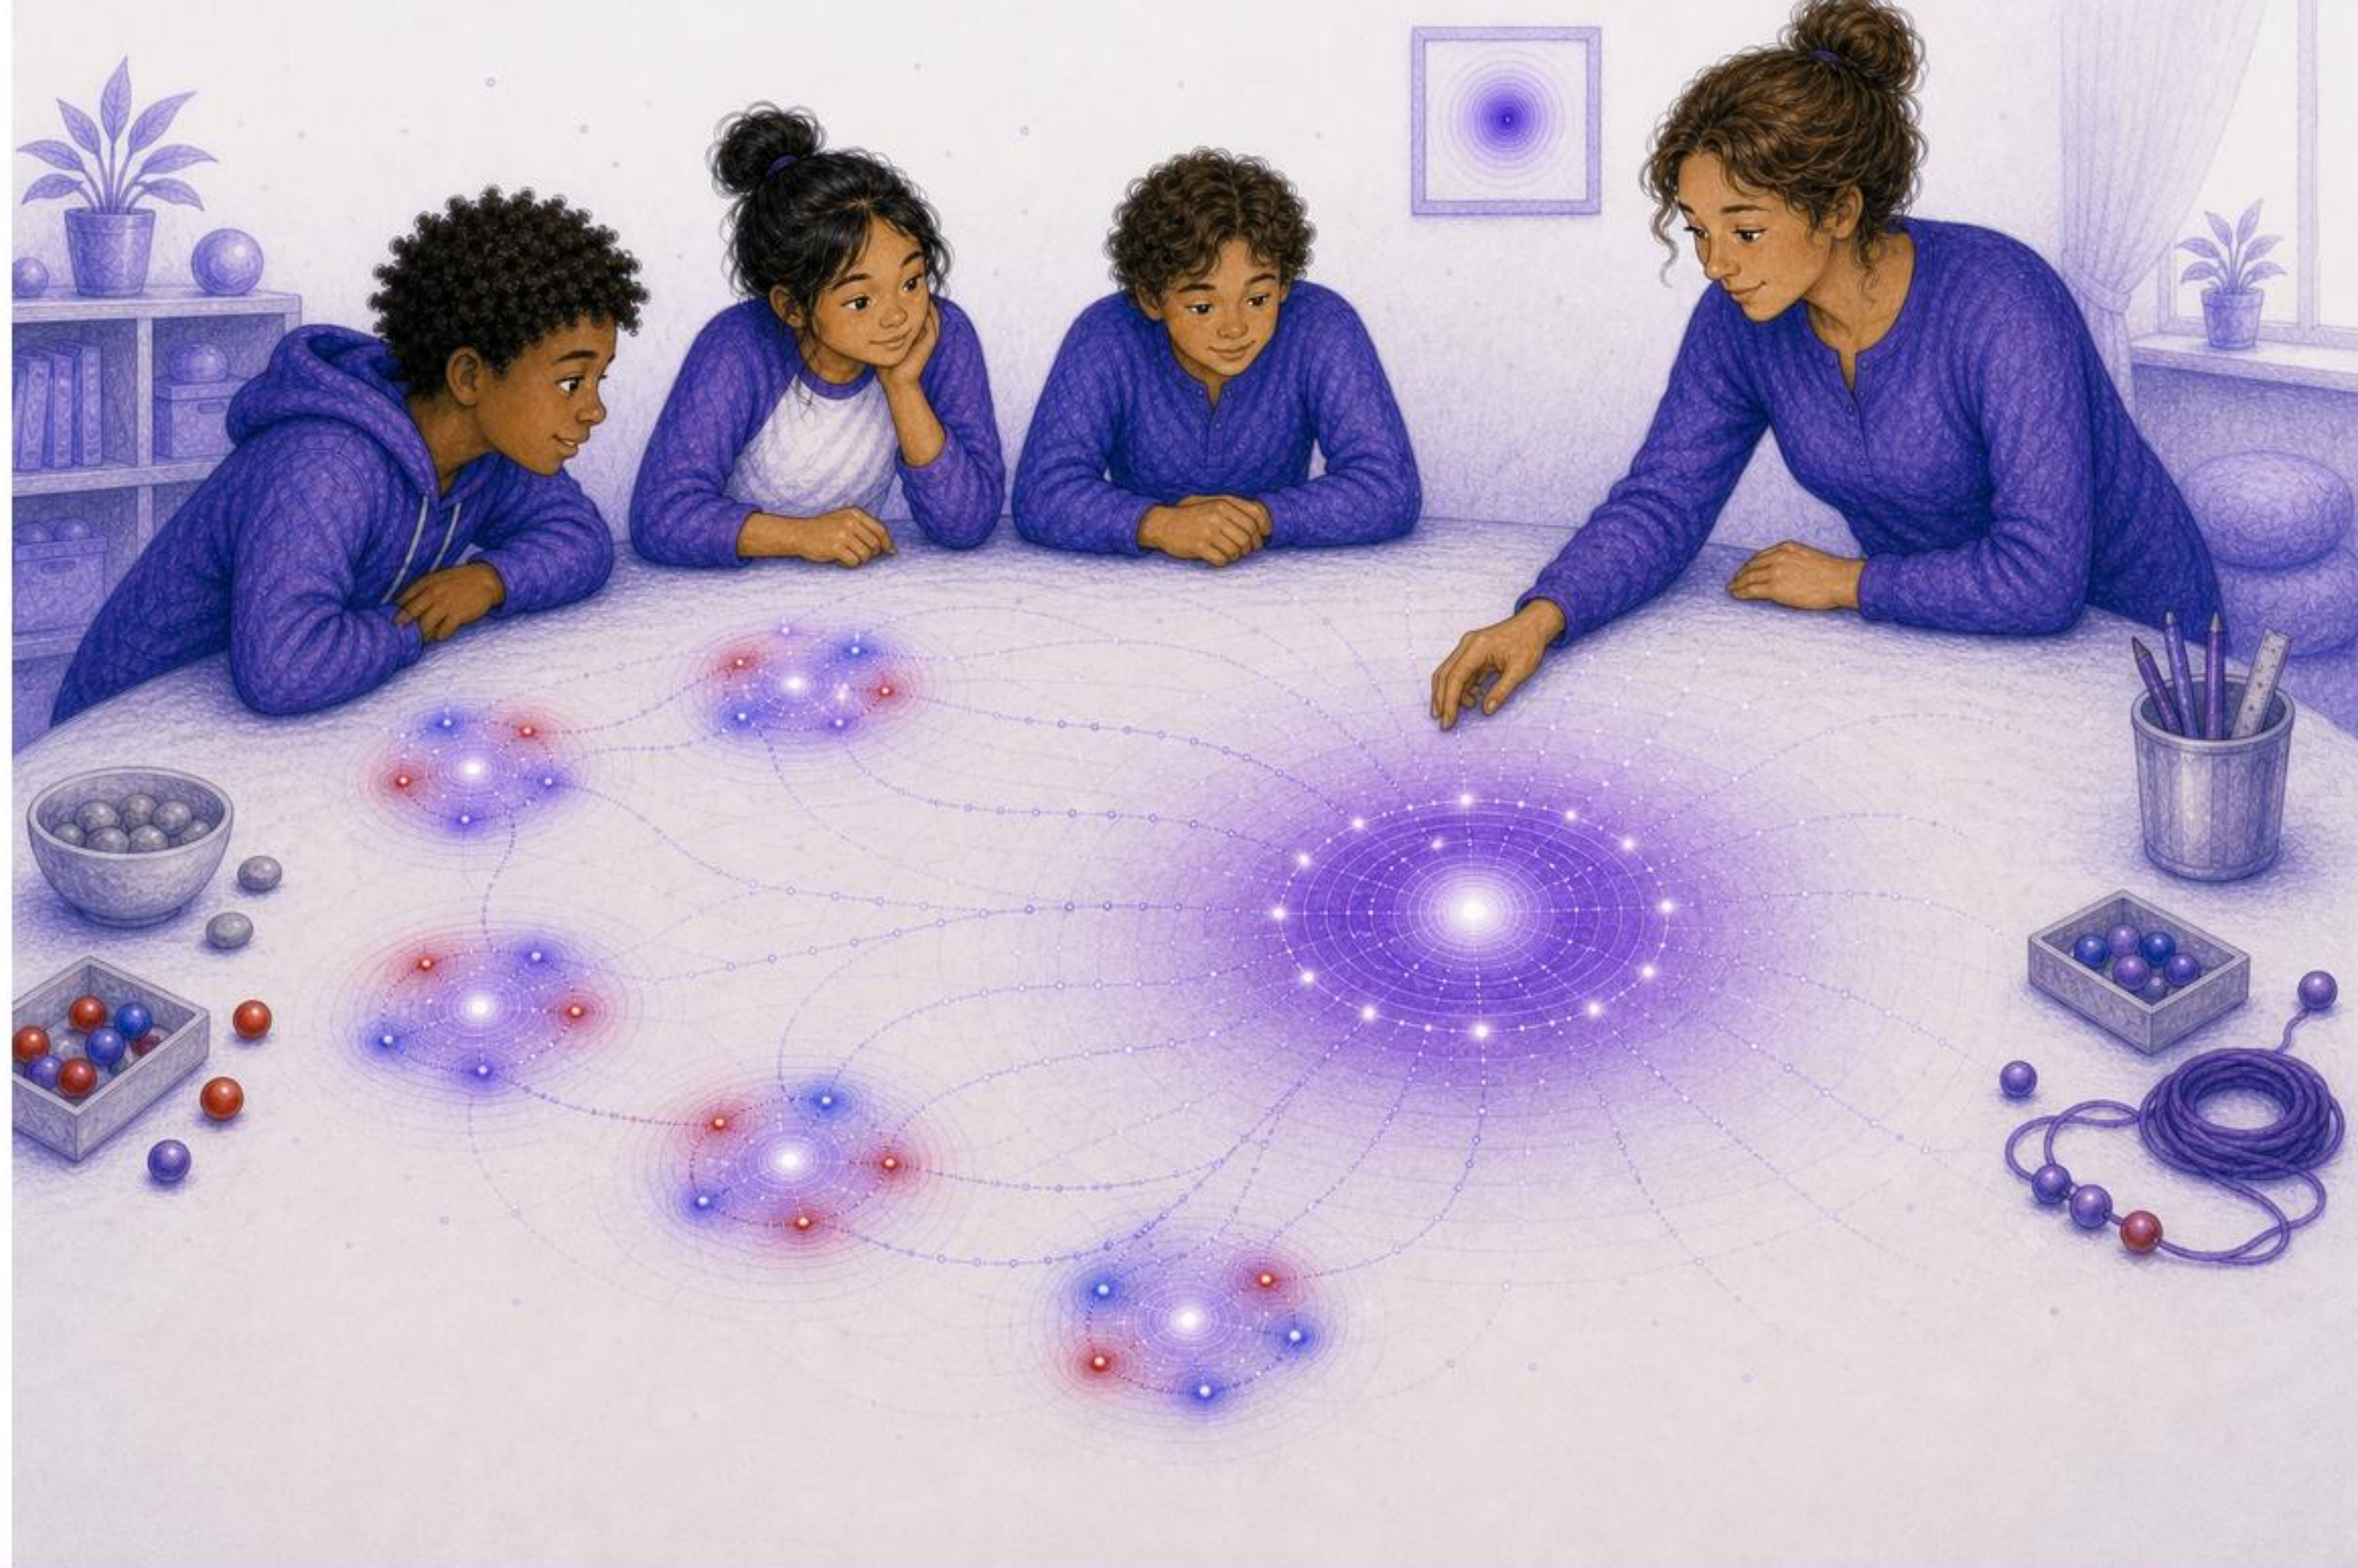

Tomas placed a clock on the table.
Mira placed a ruler beside it.
Dr. Sol moved them to the far end.
"These are things we must recover."

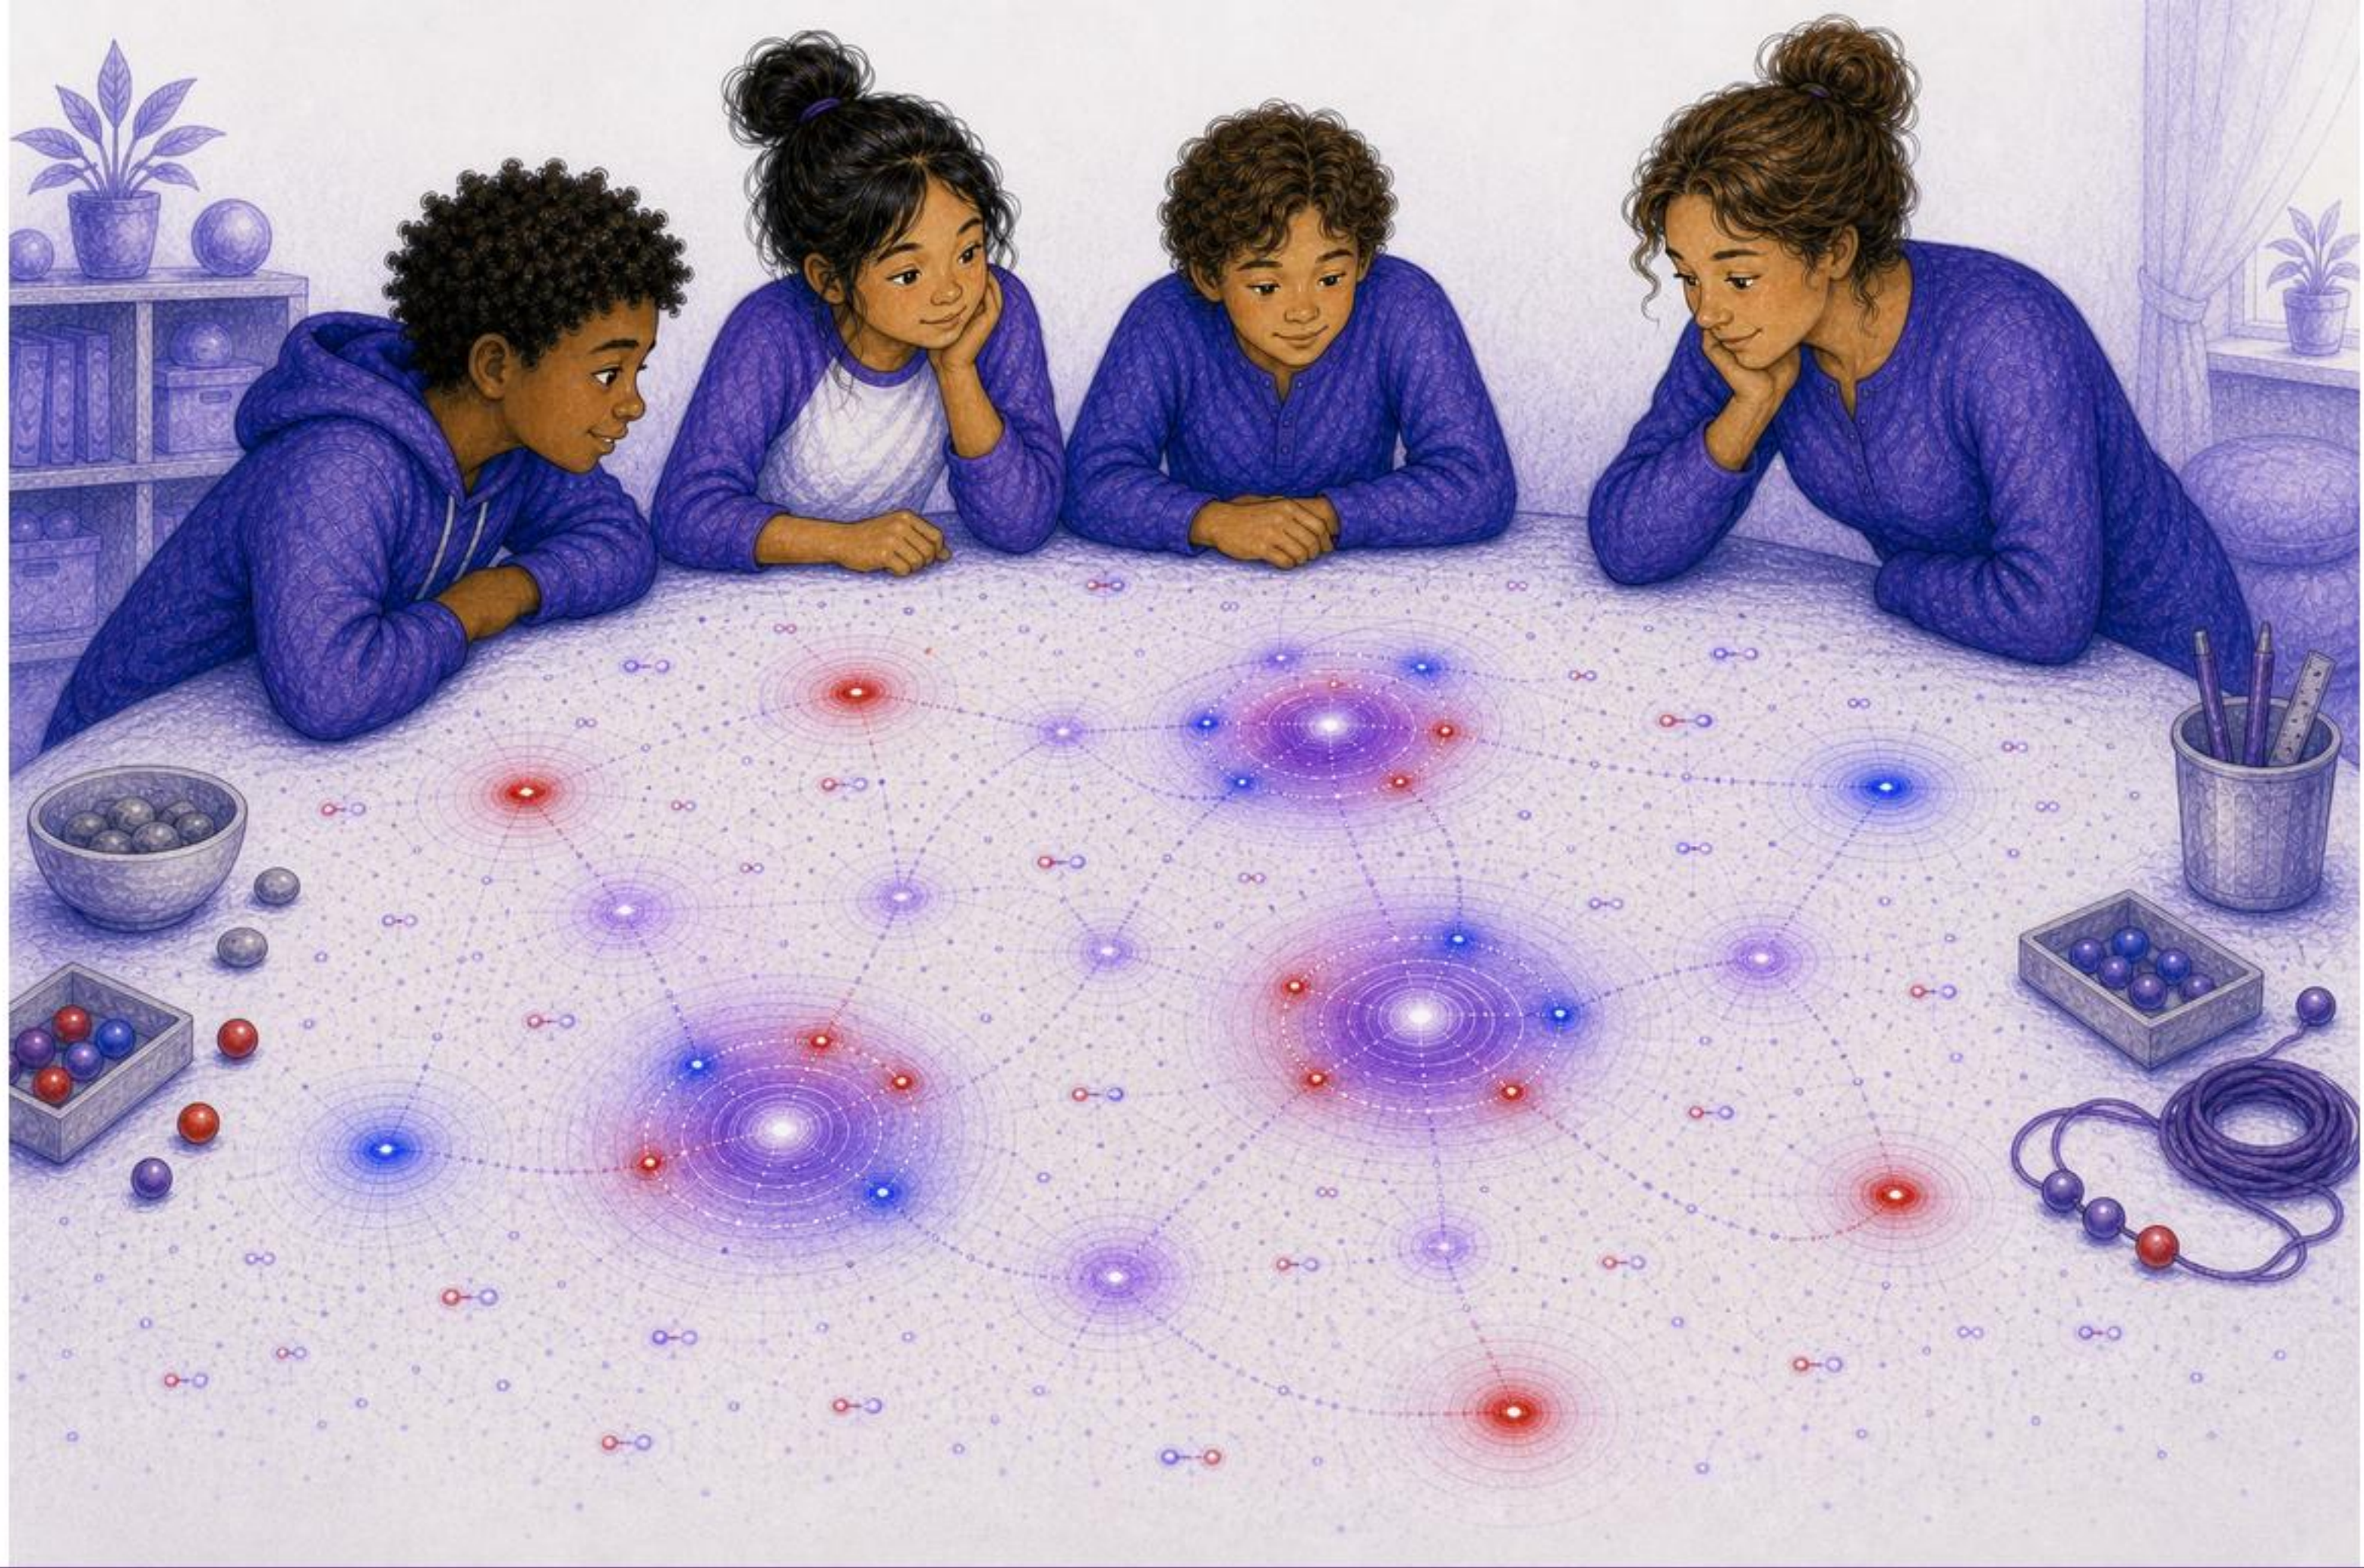

At the left edge, the table was full of tiny action.
Red points.
Blue points.
Paths and waves.

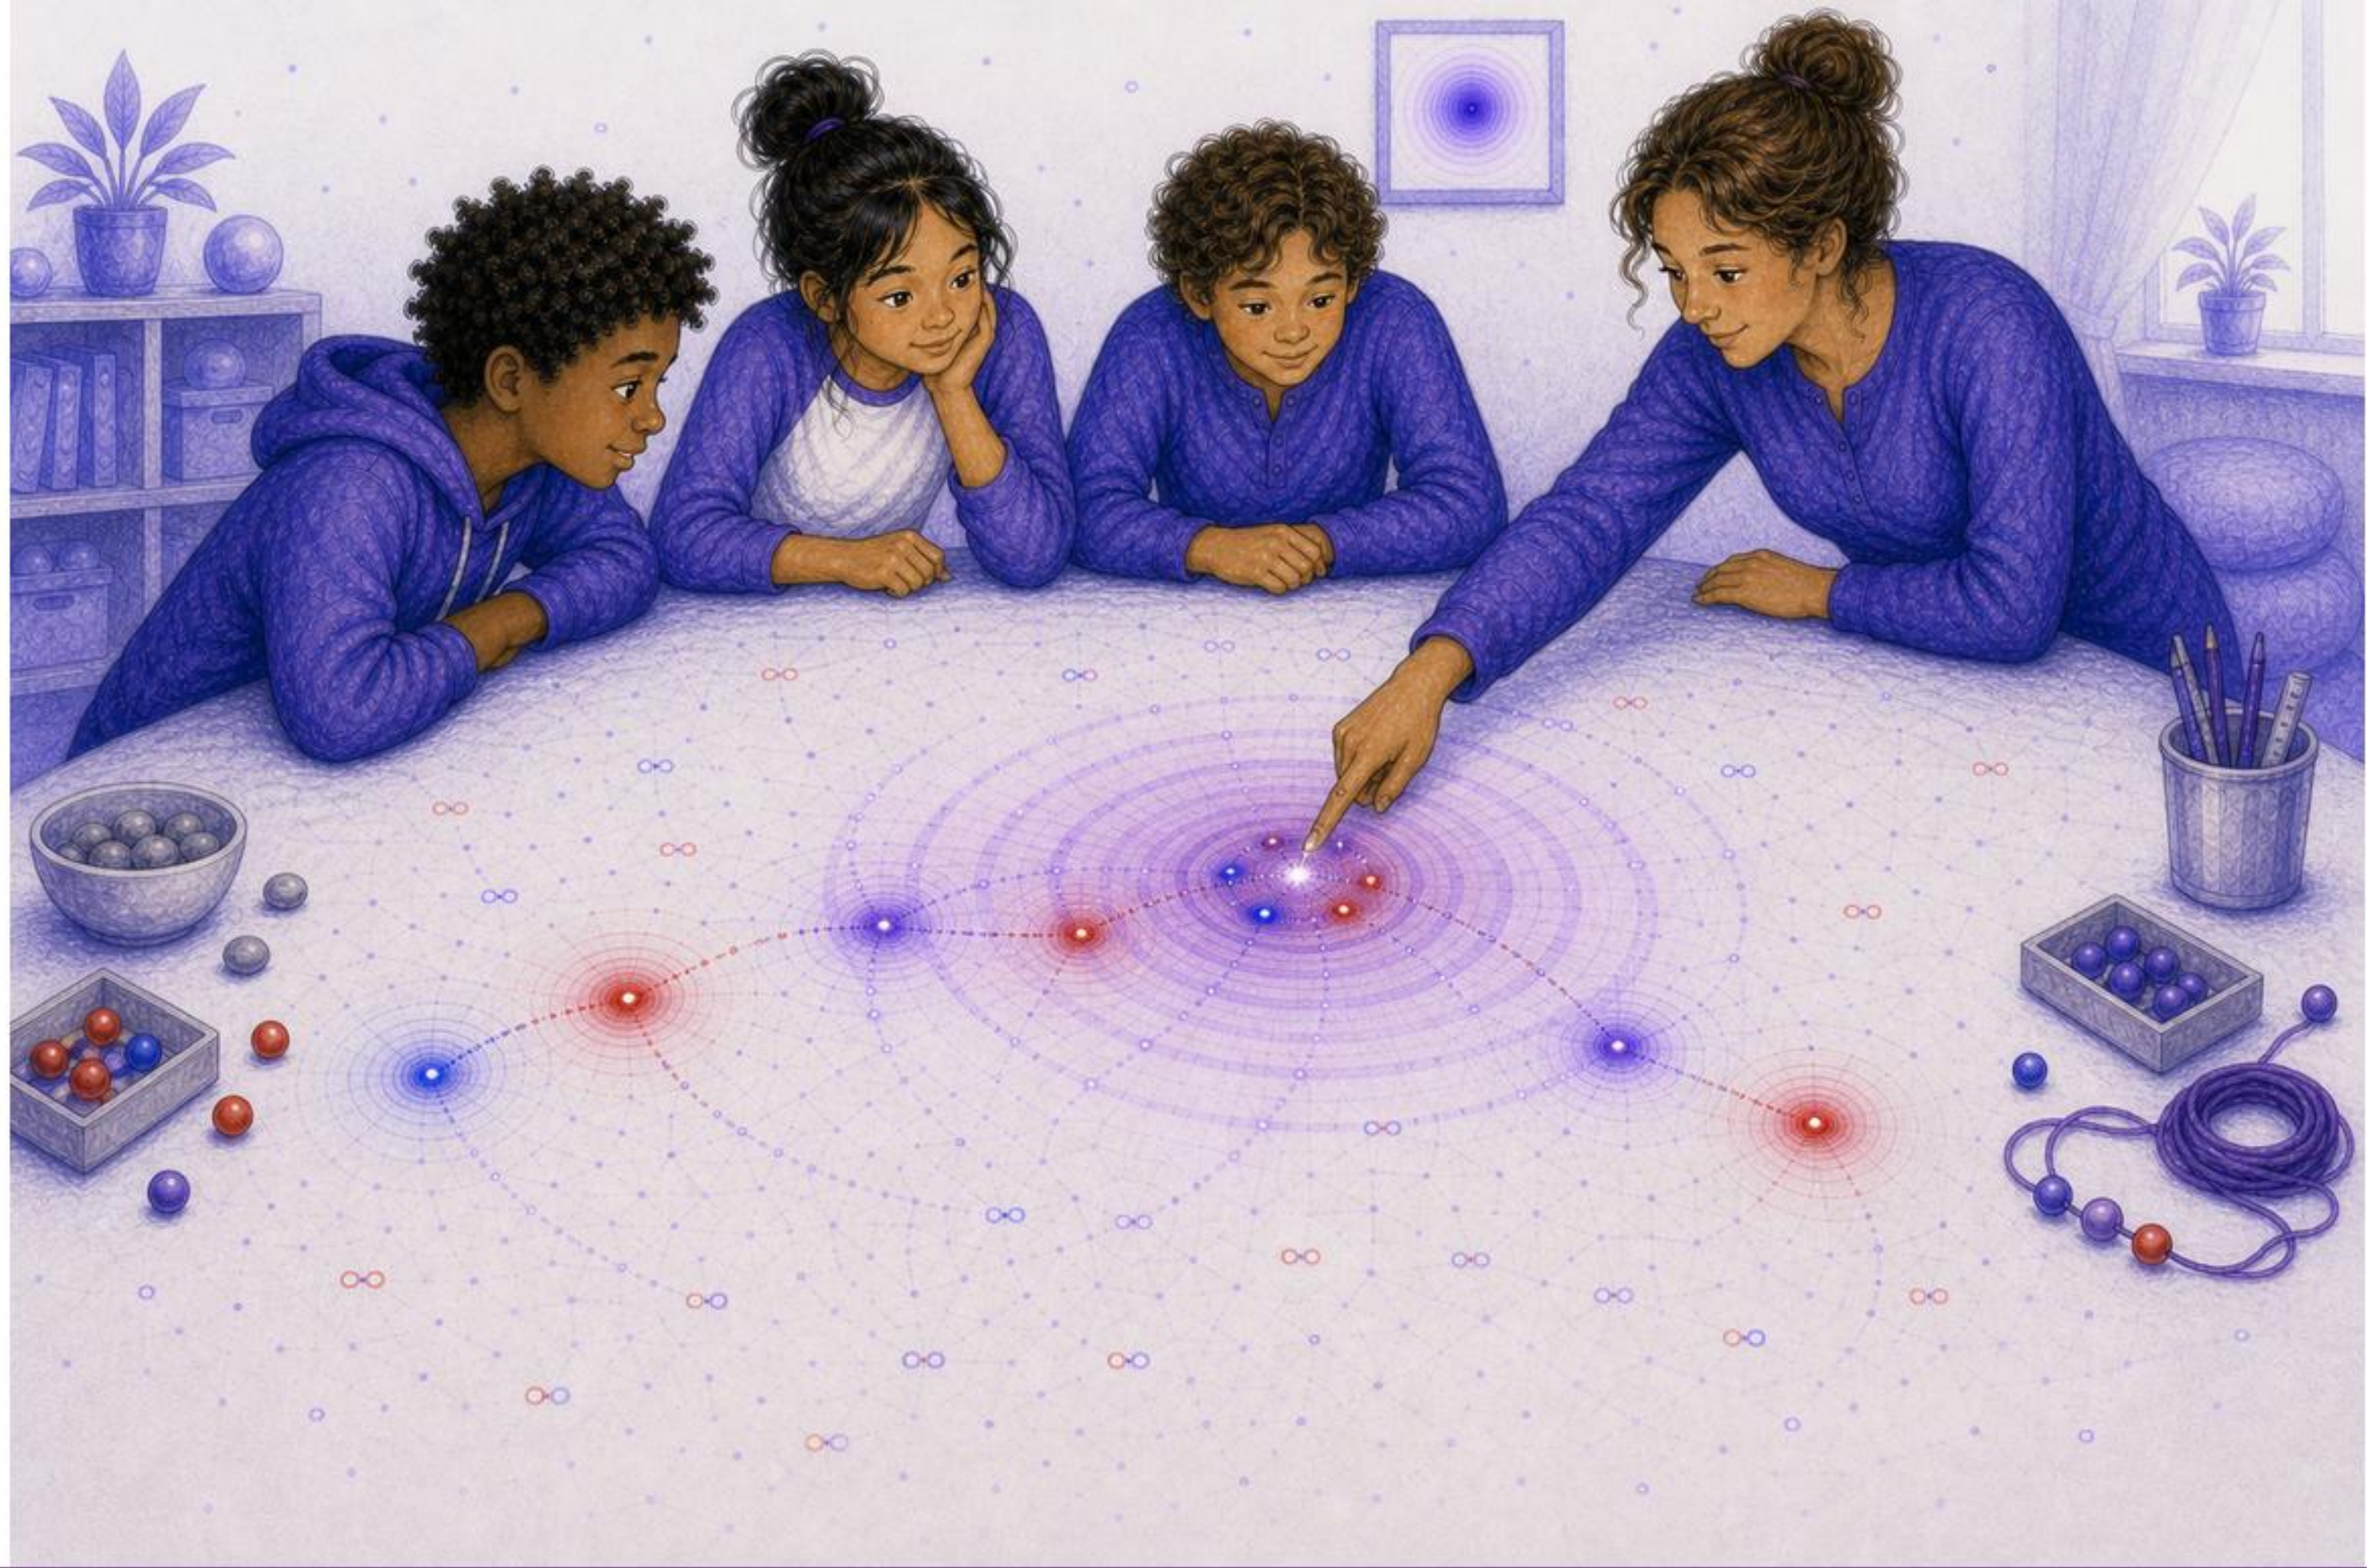

Some paths closed into a pattern.
The parts still moved.
The relation held.

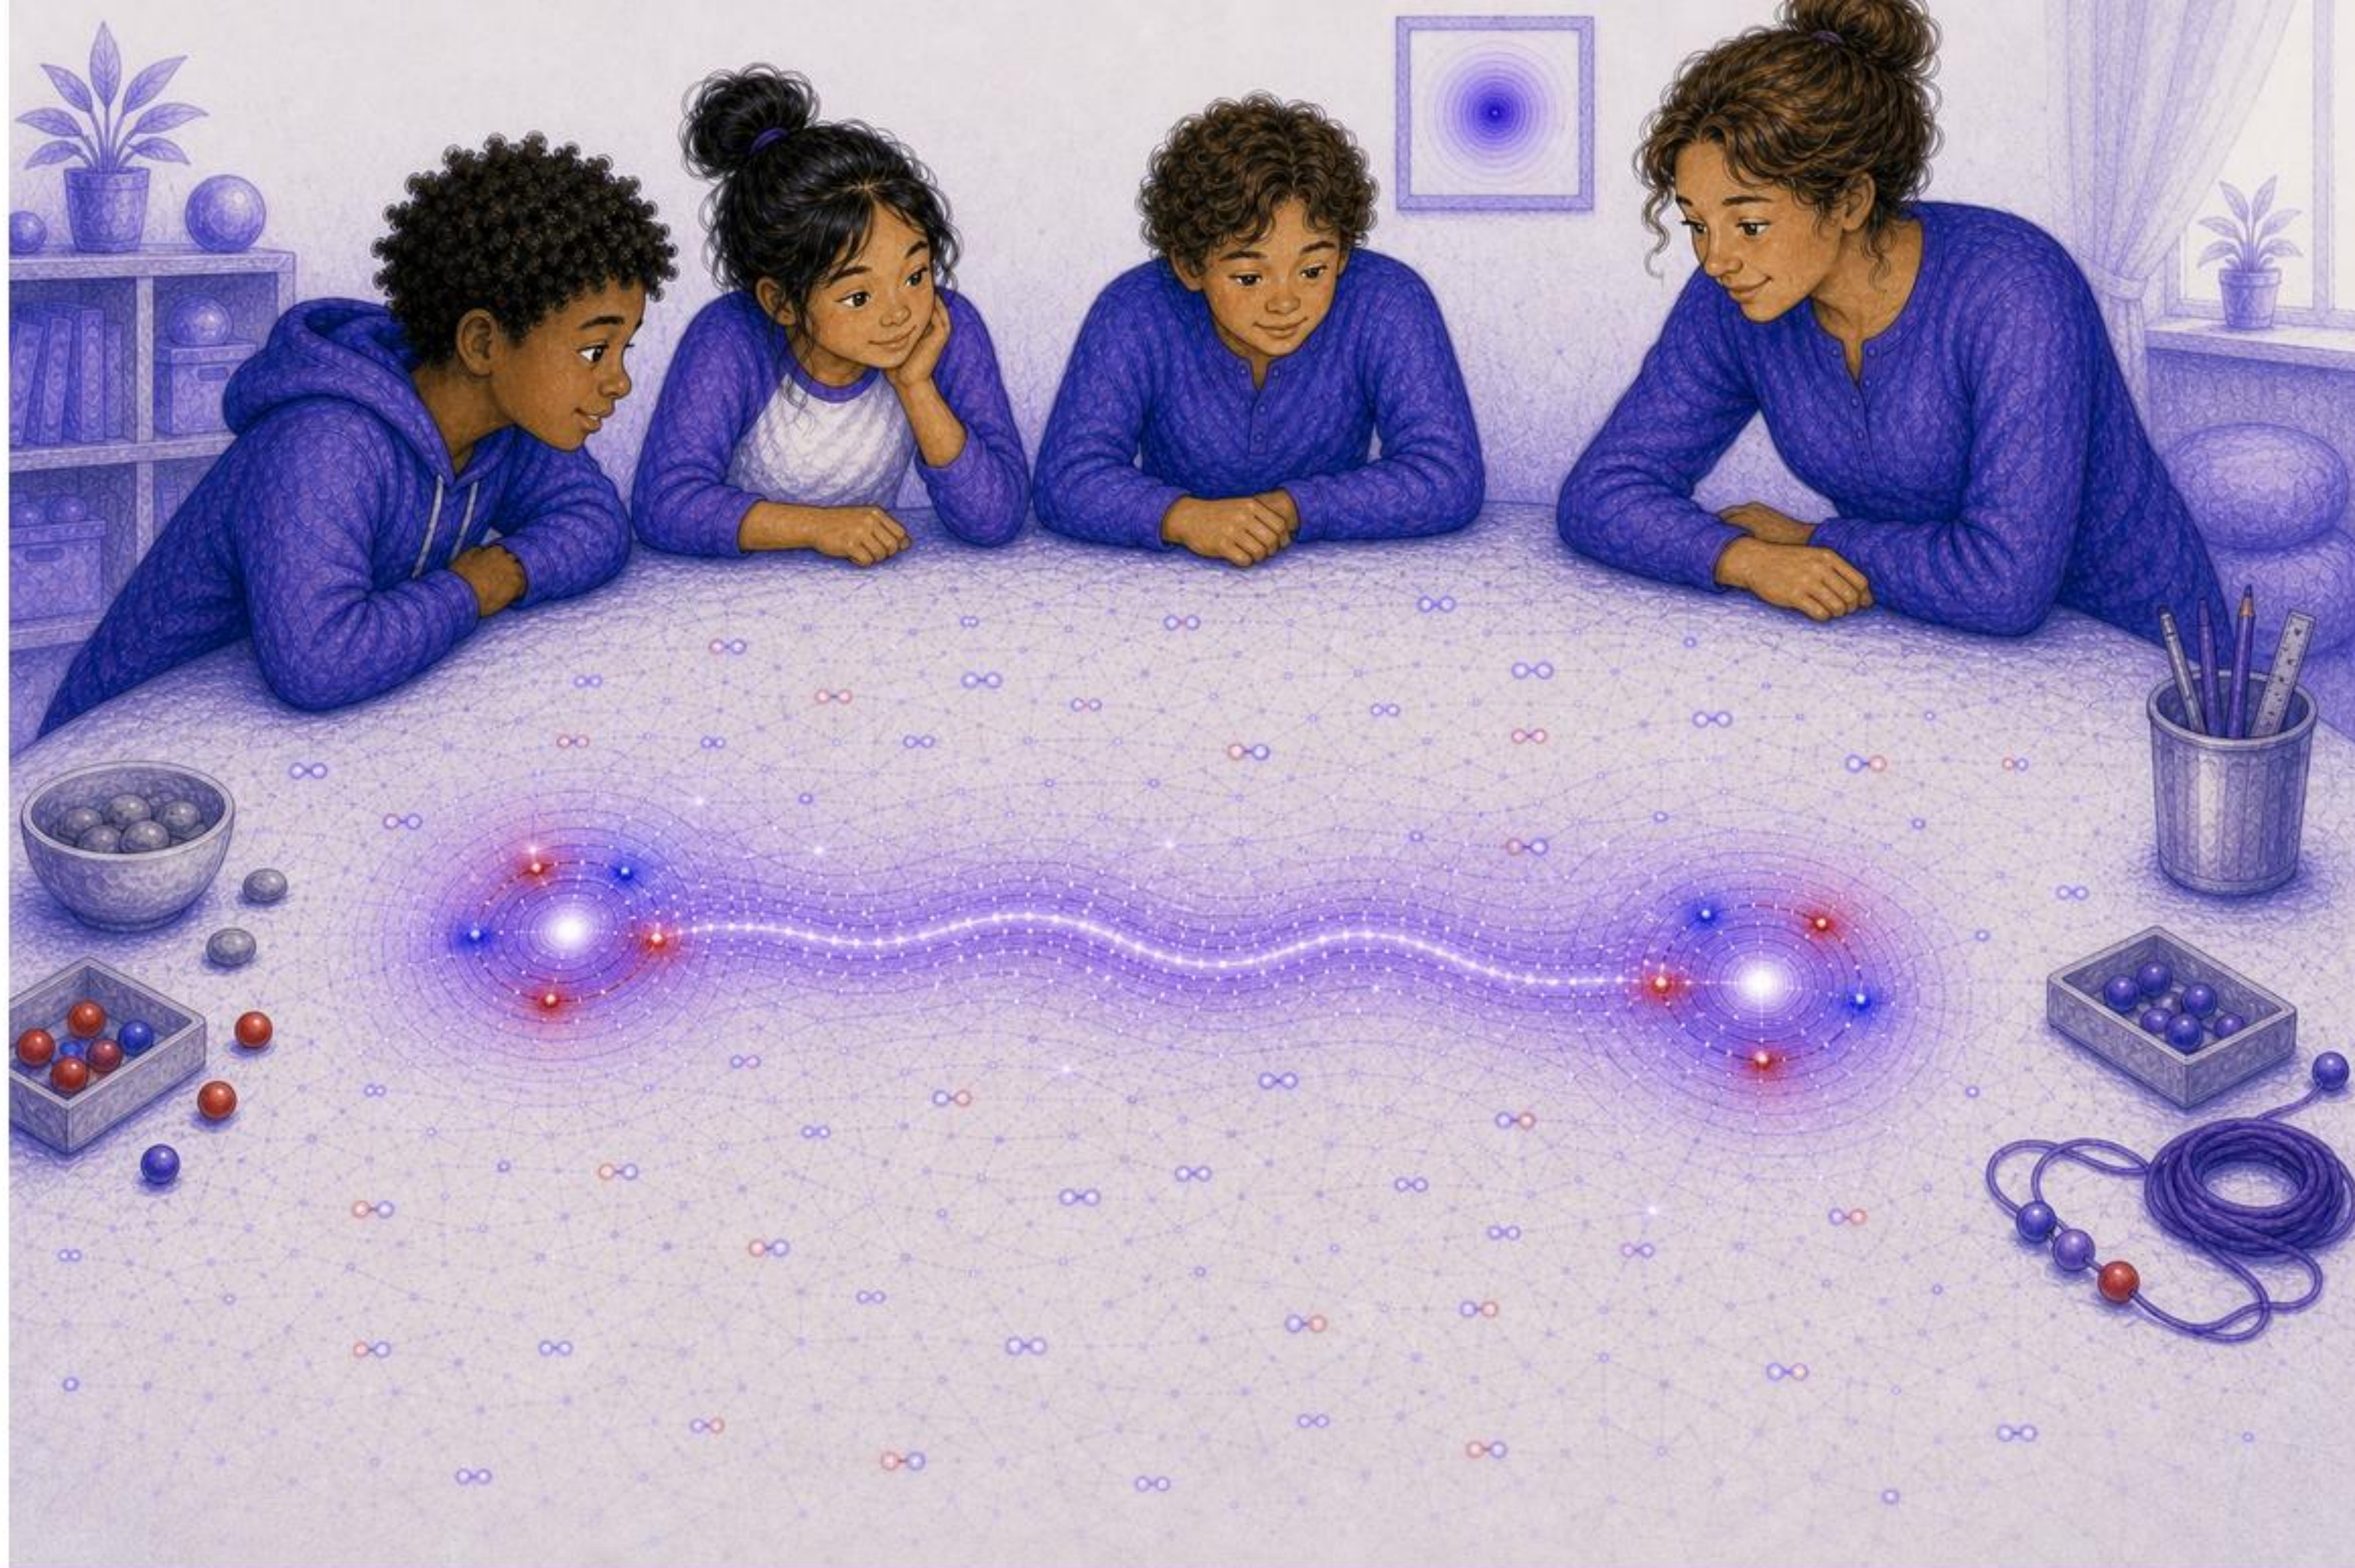

The first pattern became part of a larger pattern.
The larger pattern held too.

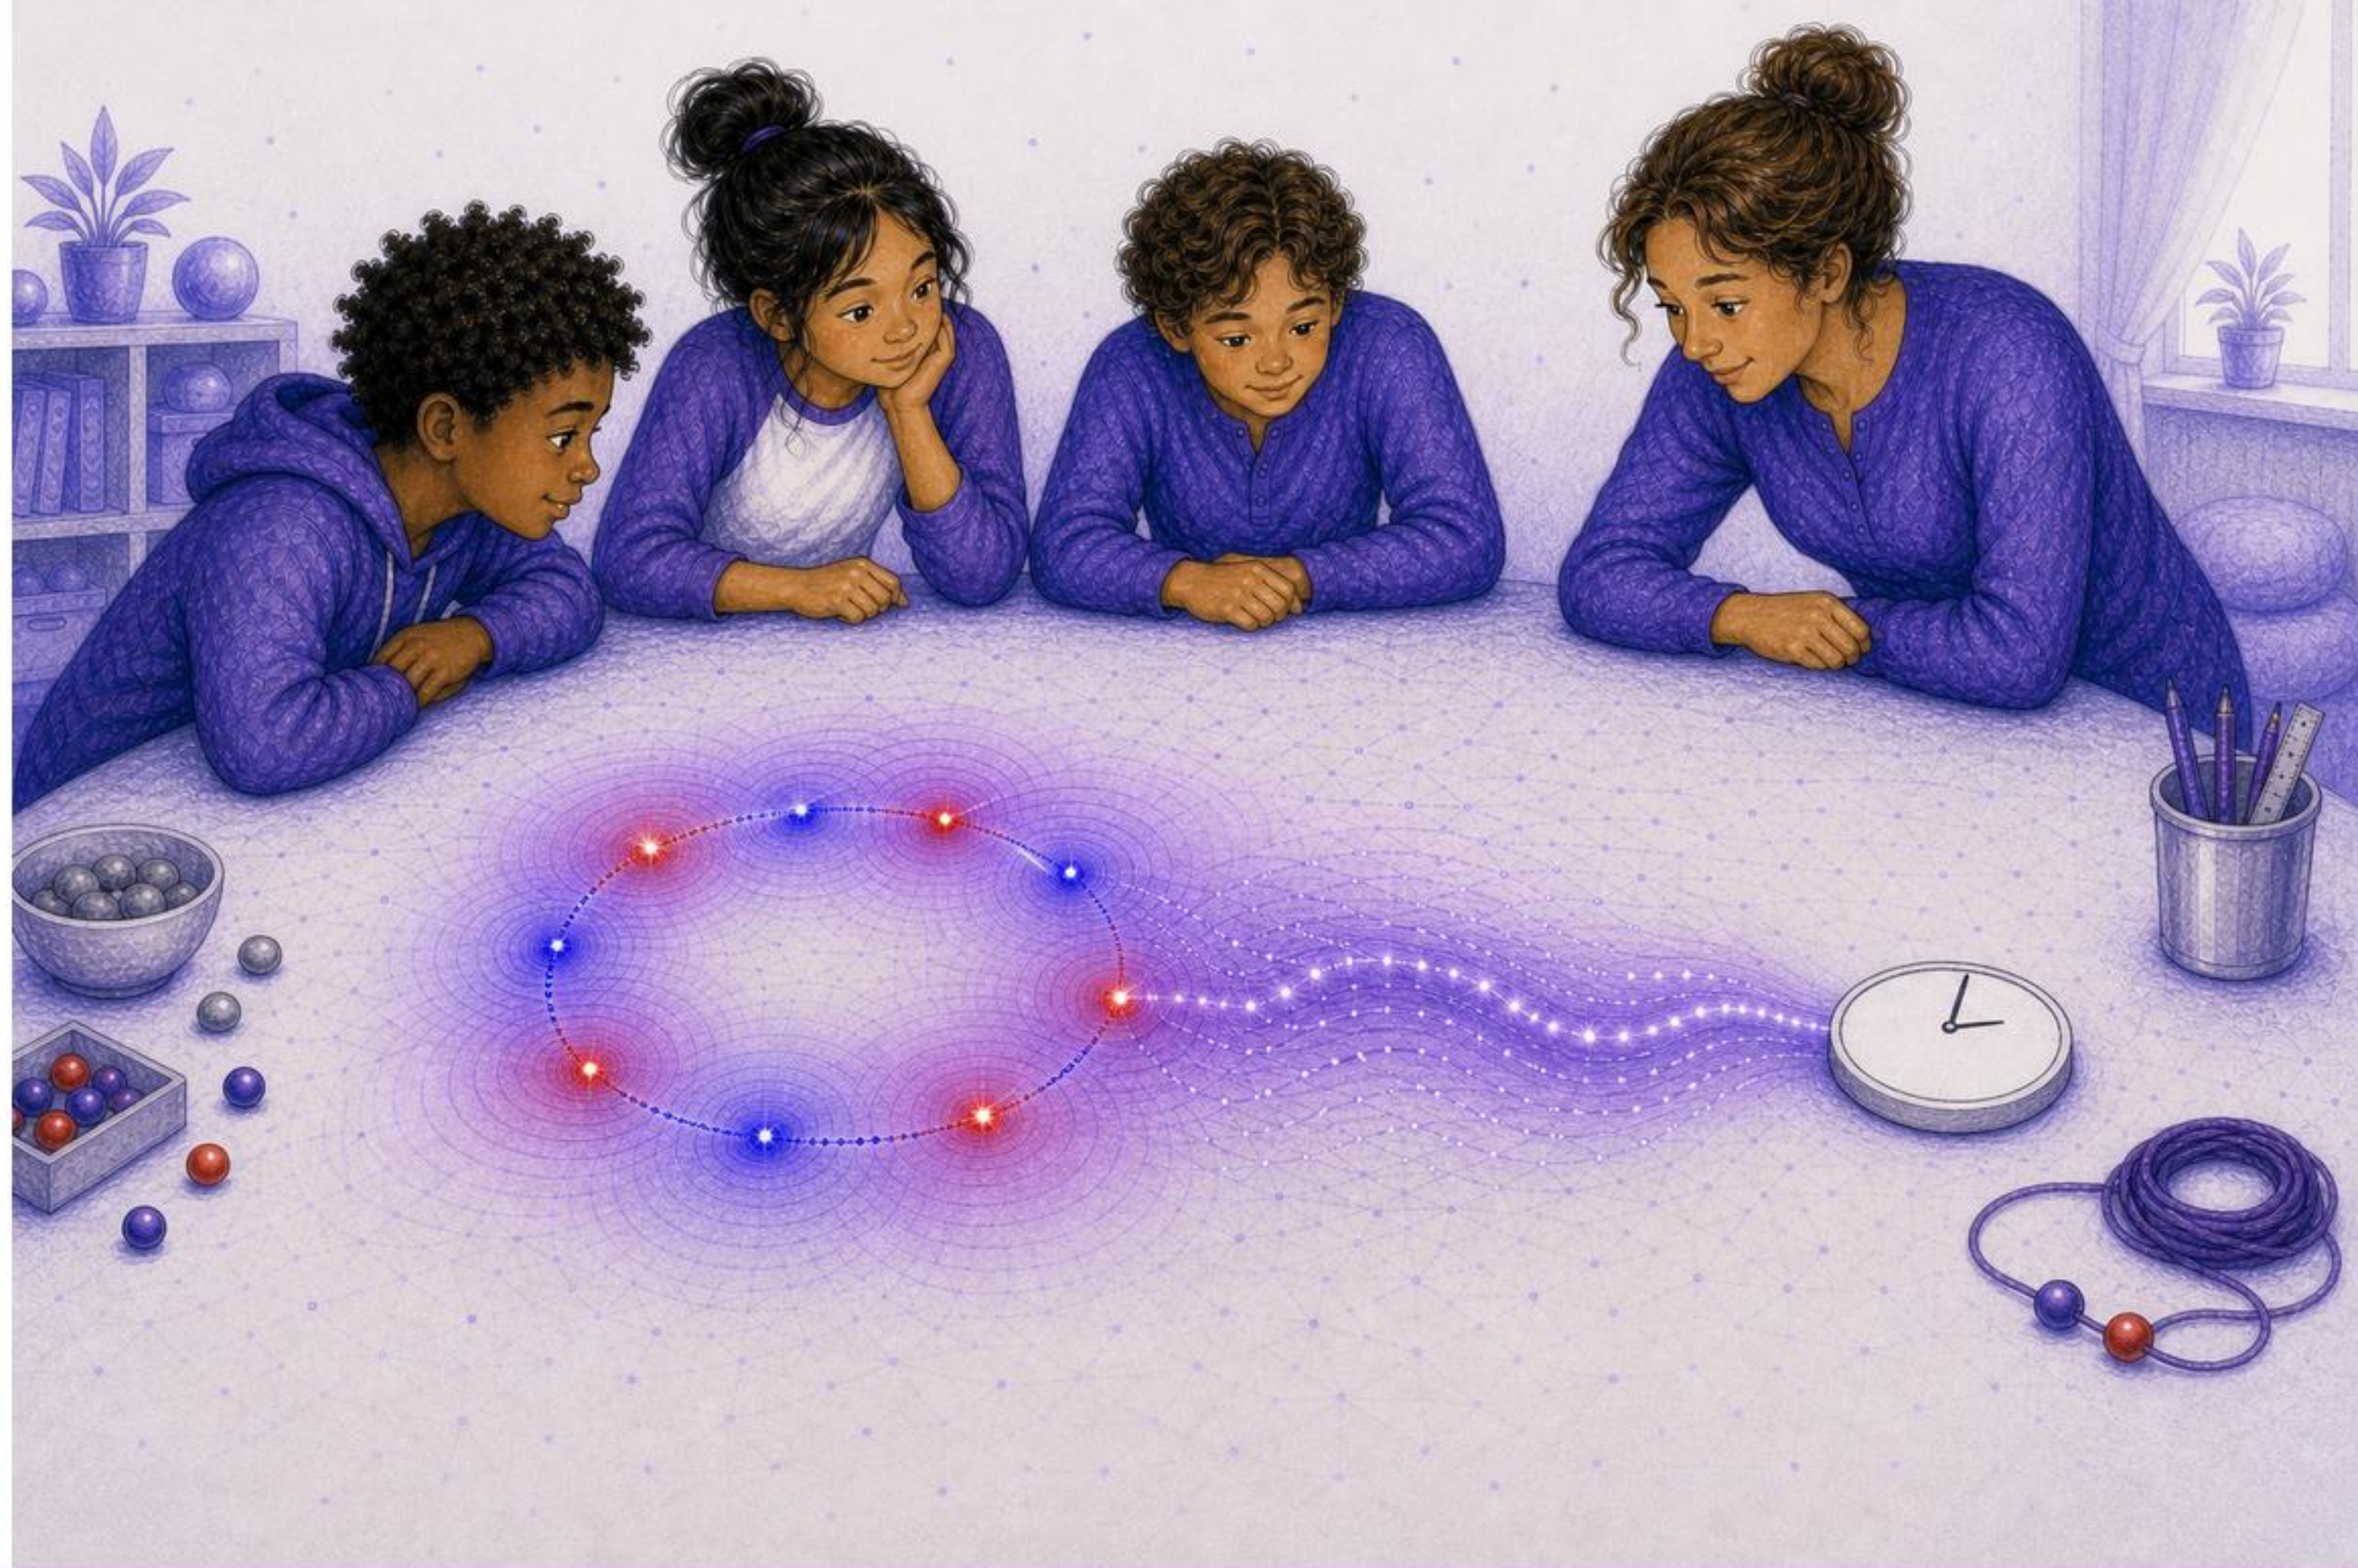

Between the assemblies, the table was not empty.
Quiet structure filled the gaps.

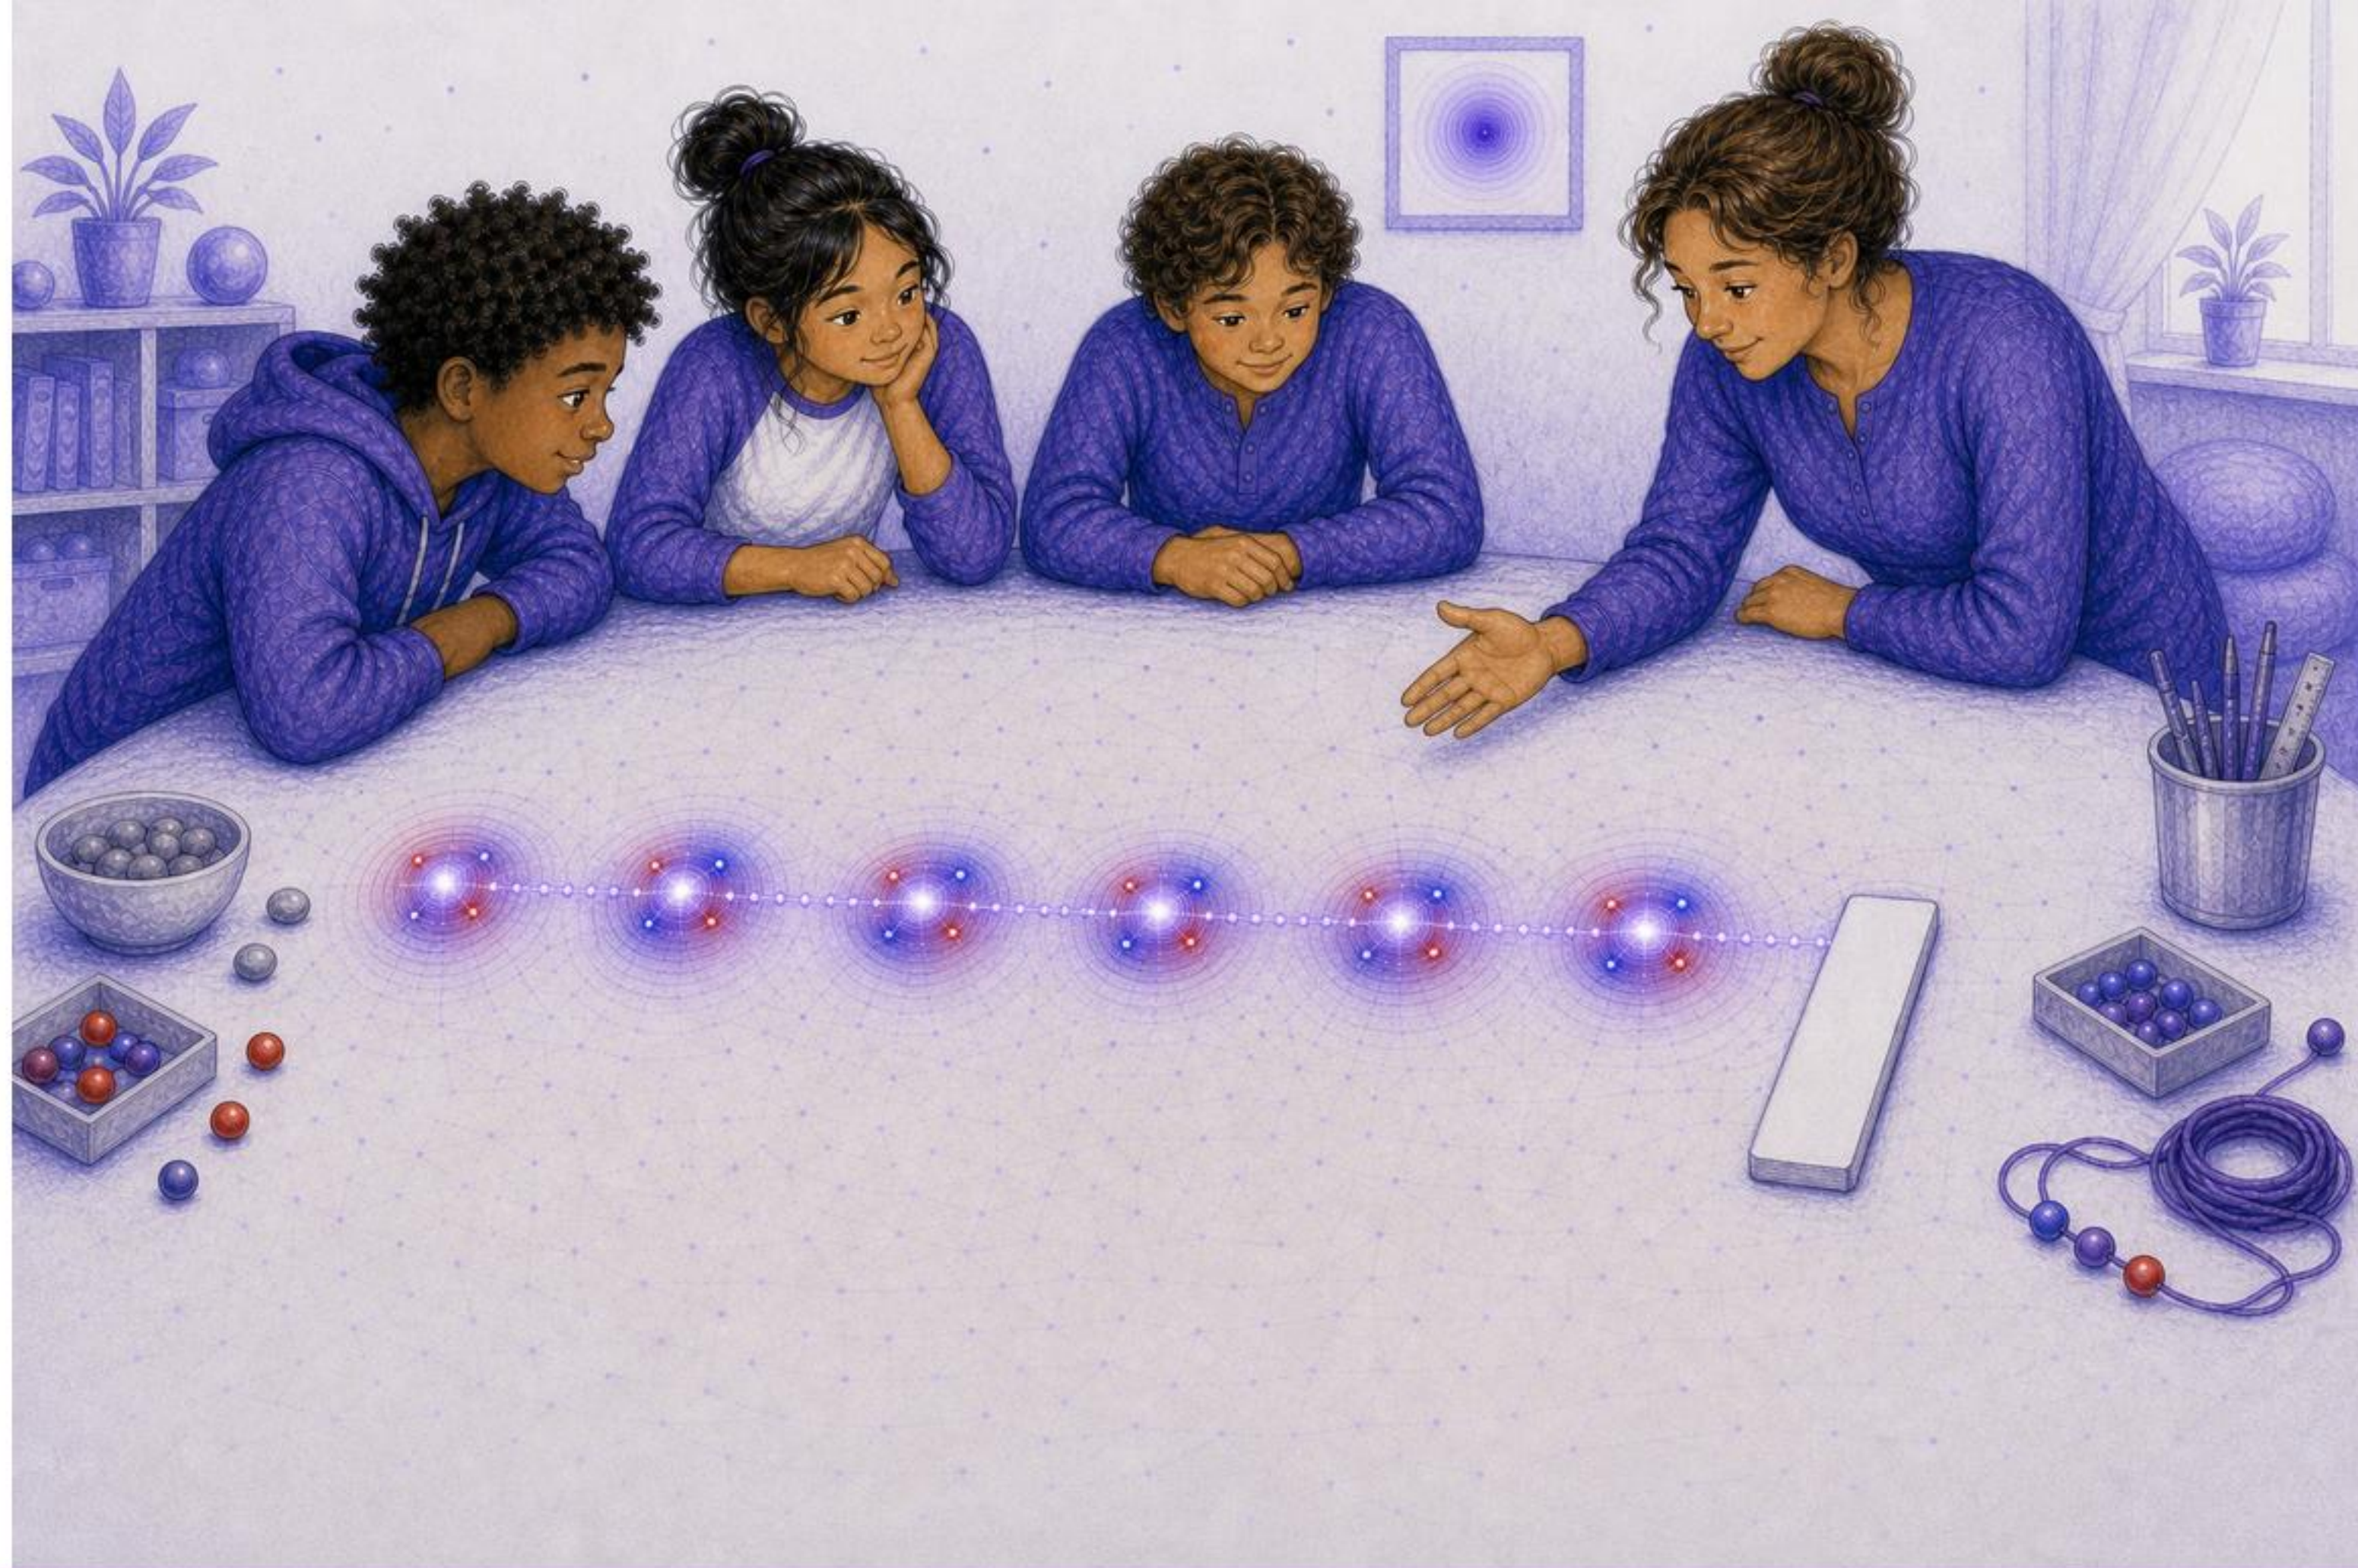

Ari tapped one assembly.
The quiet structure answered in a wave.

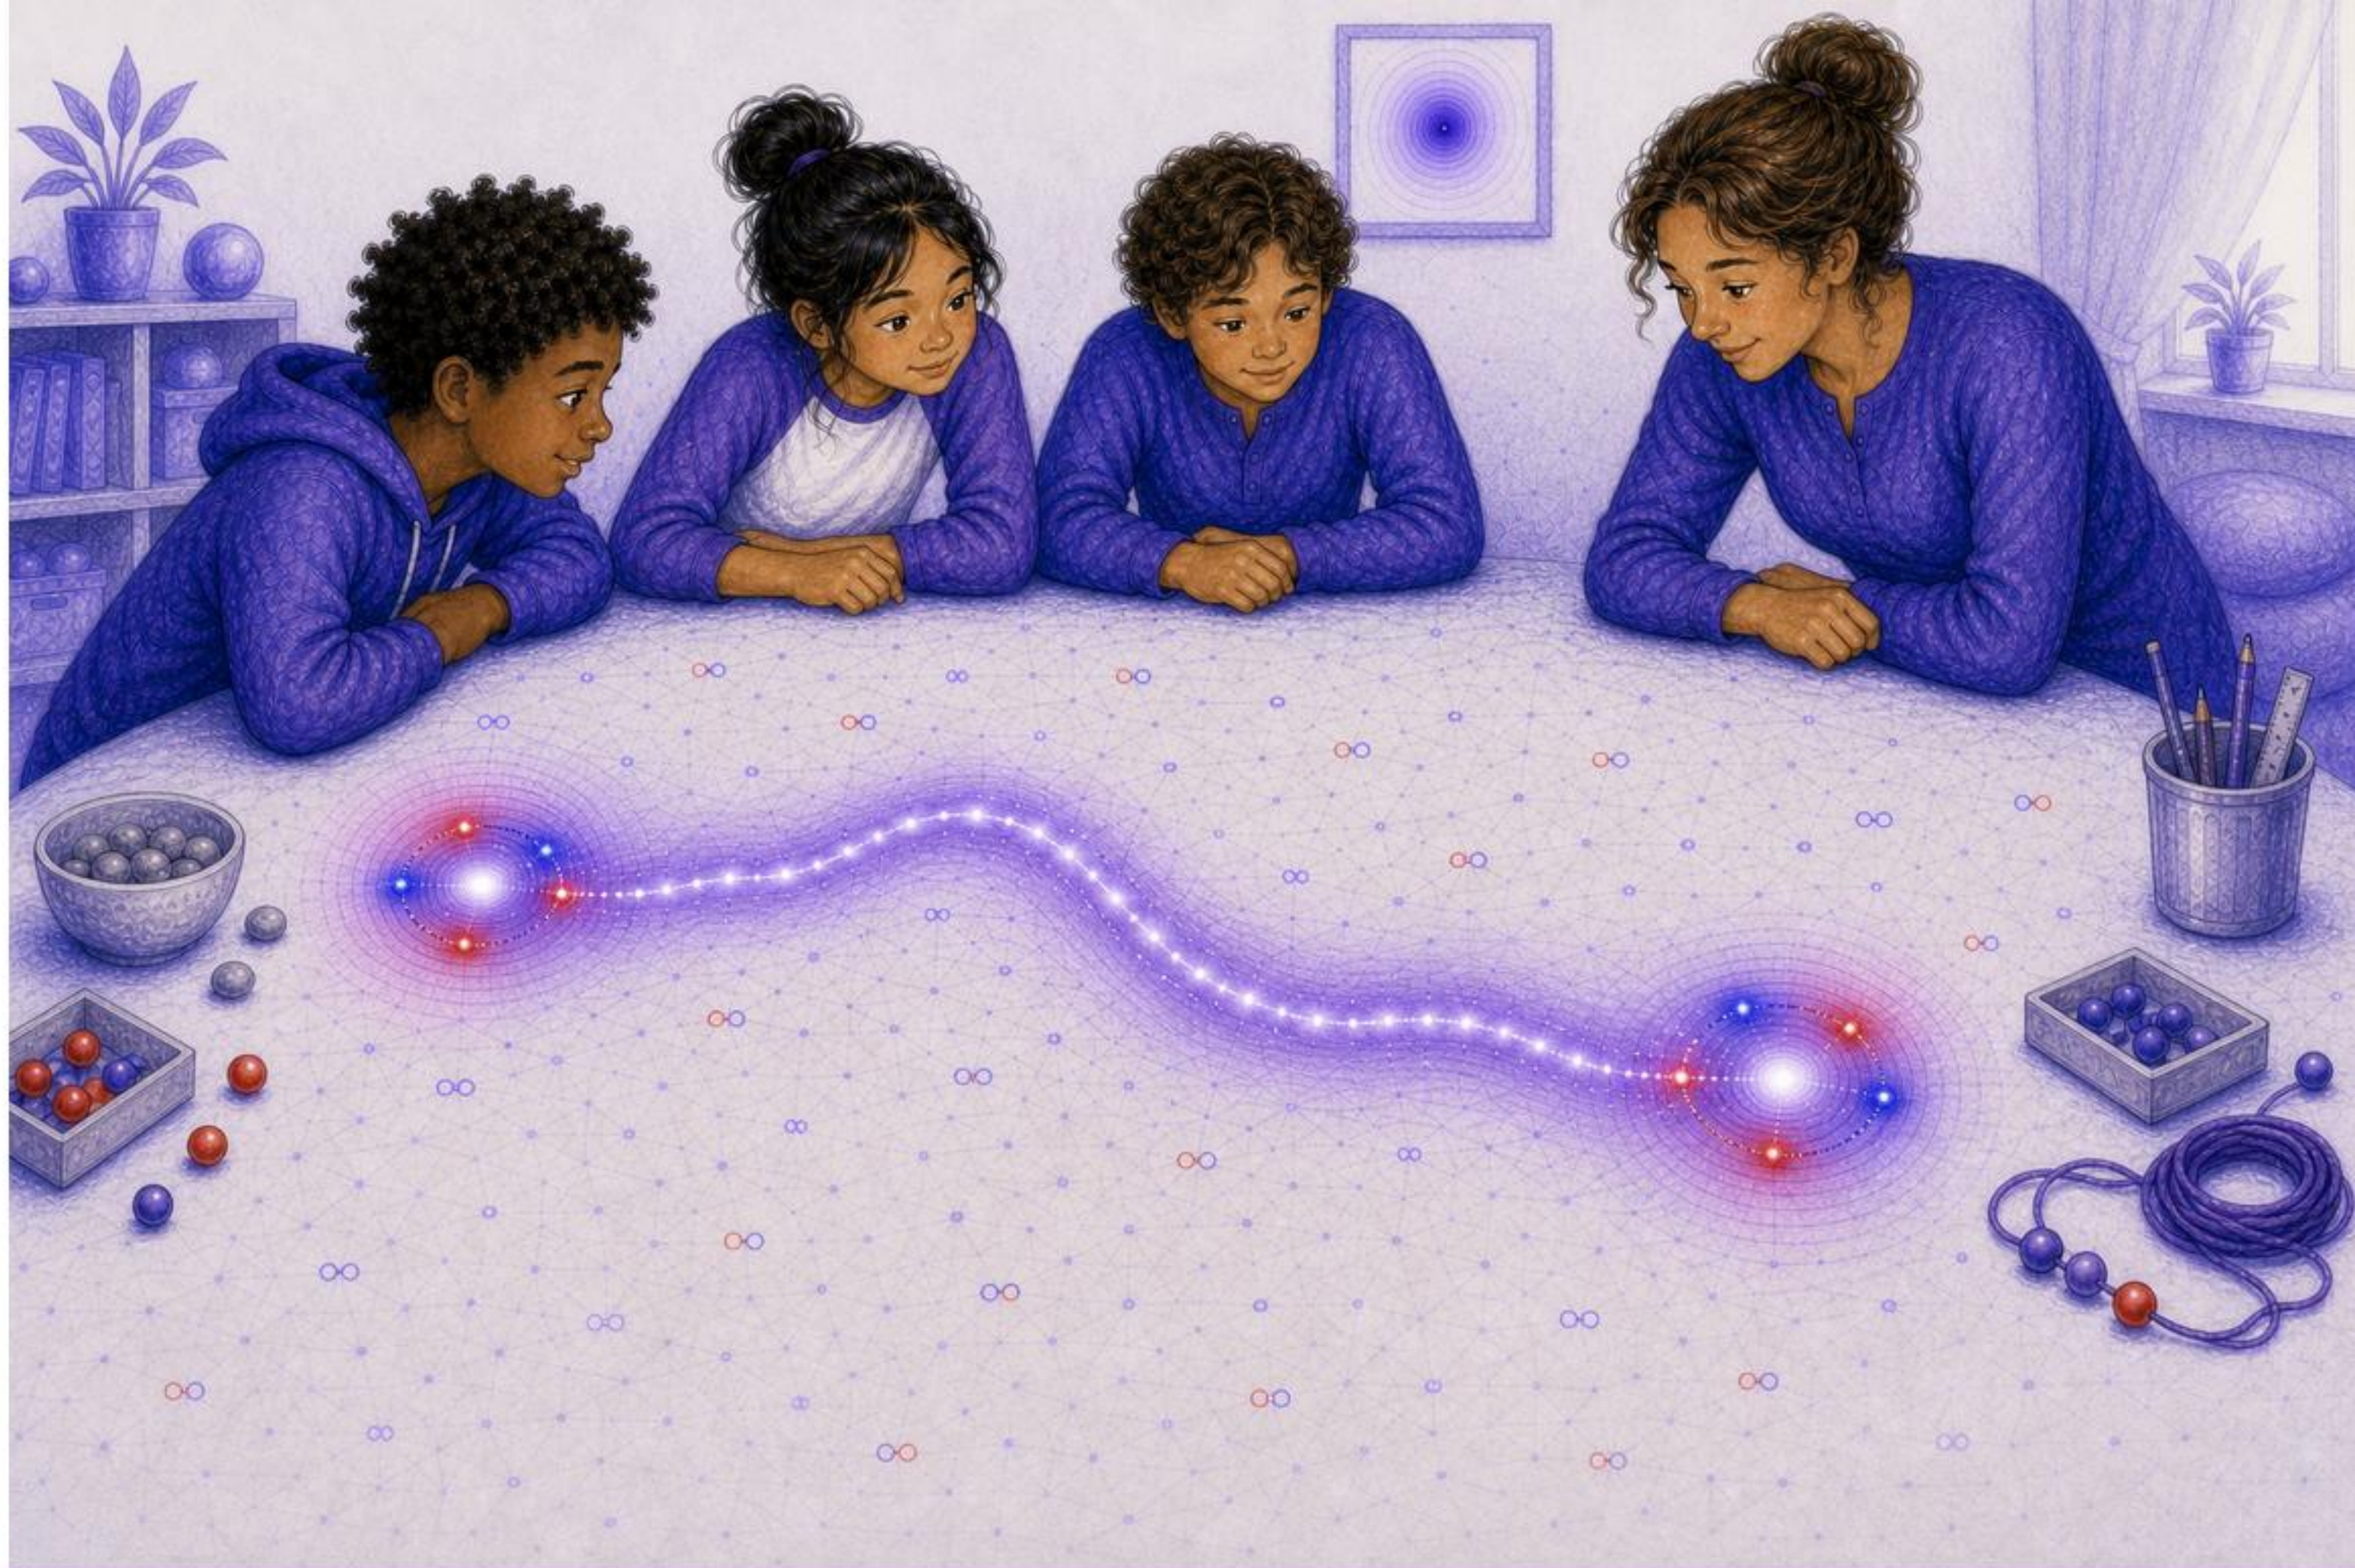

The response did not spread everywhere the same way.
It found a channel.

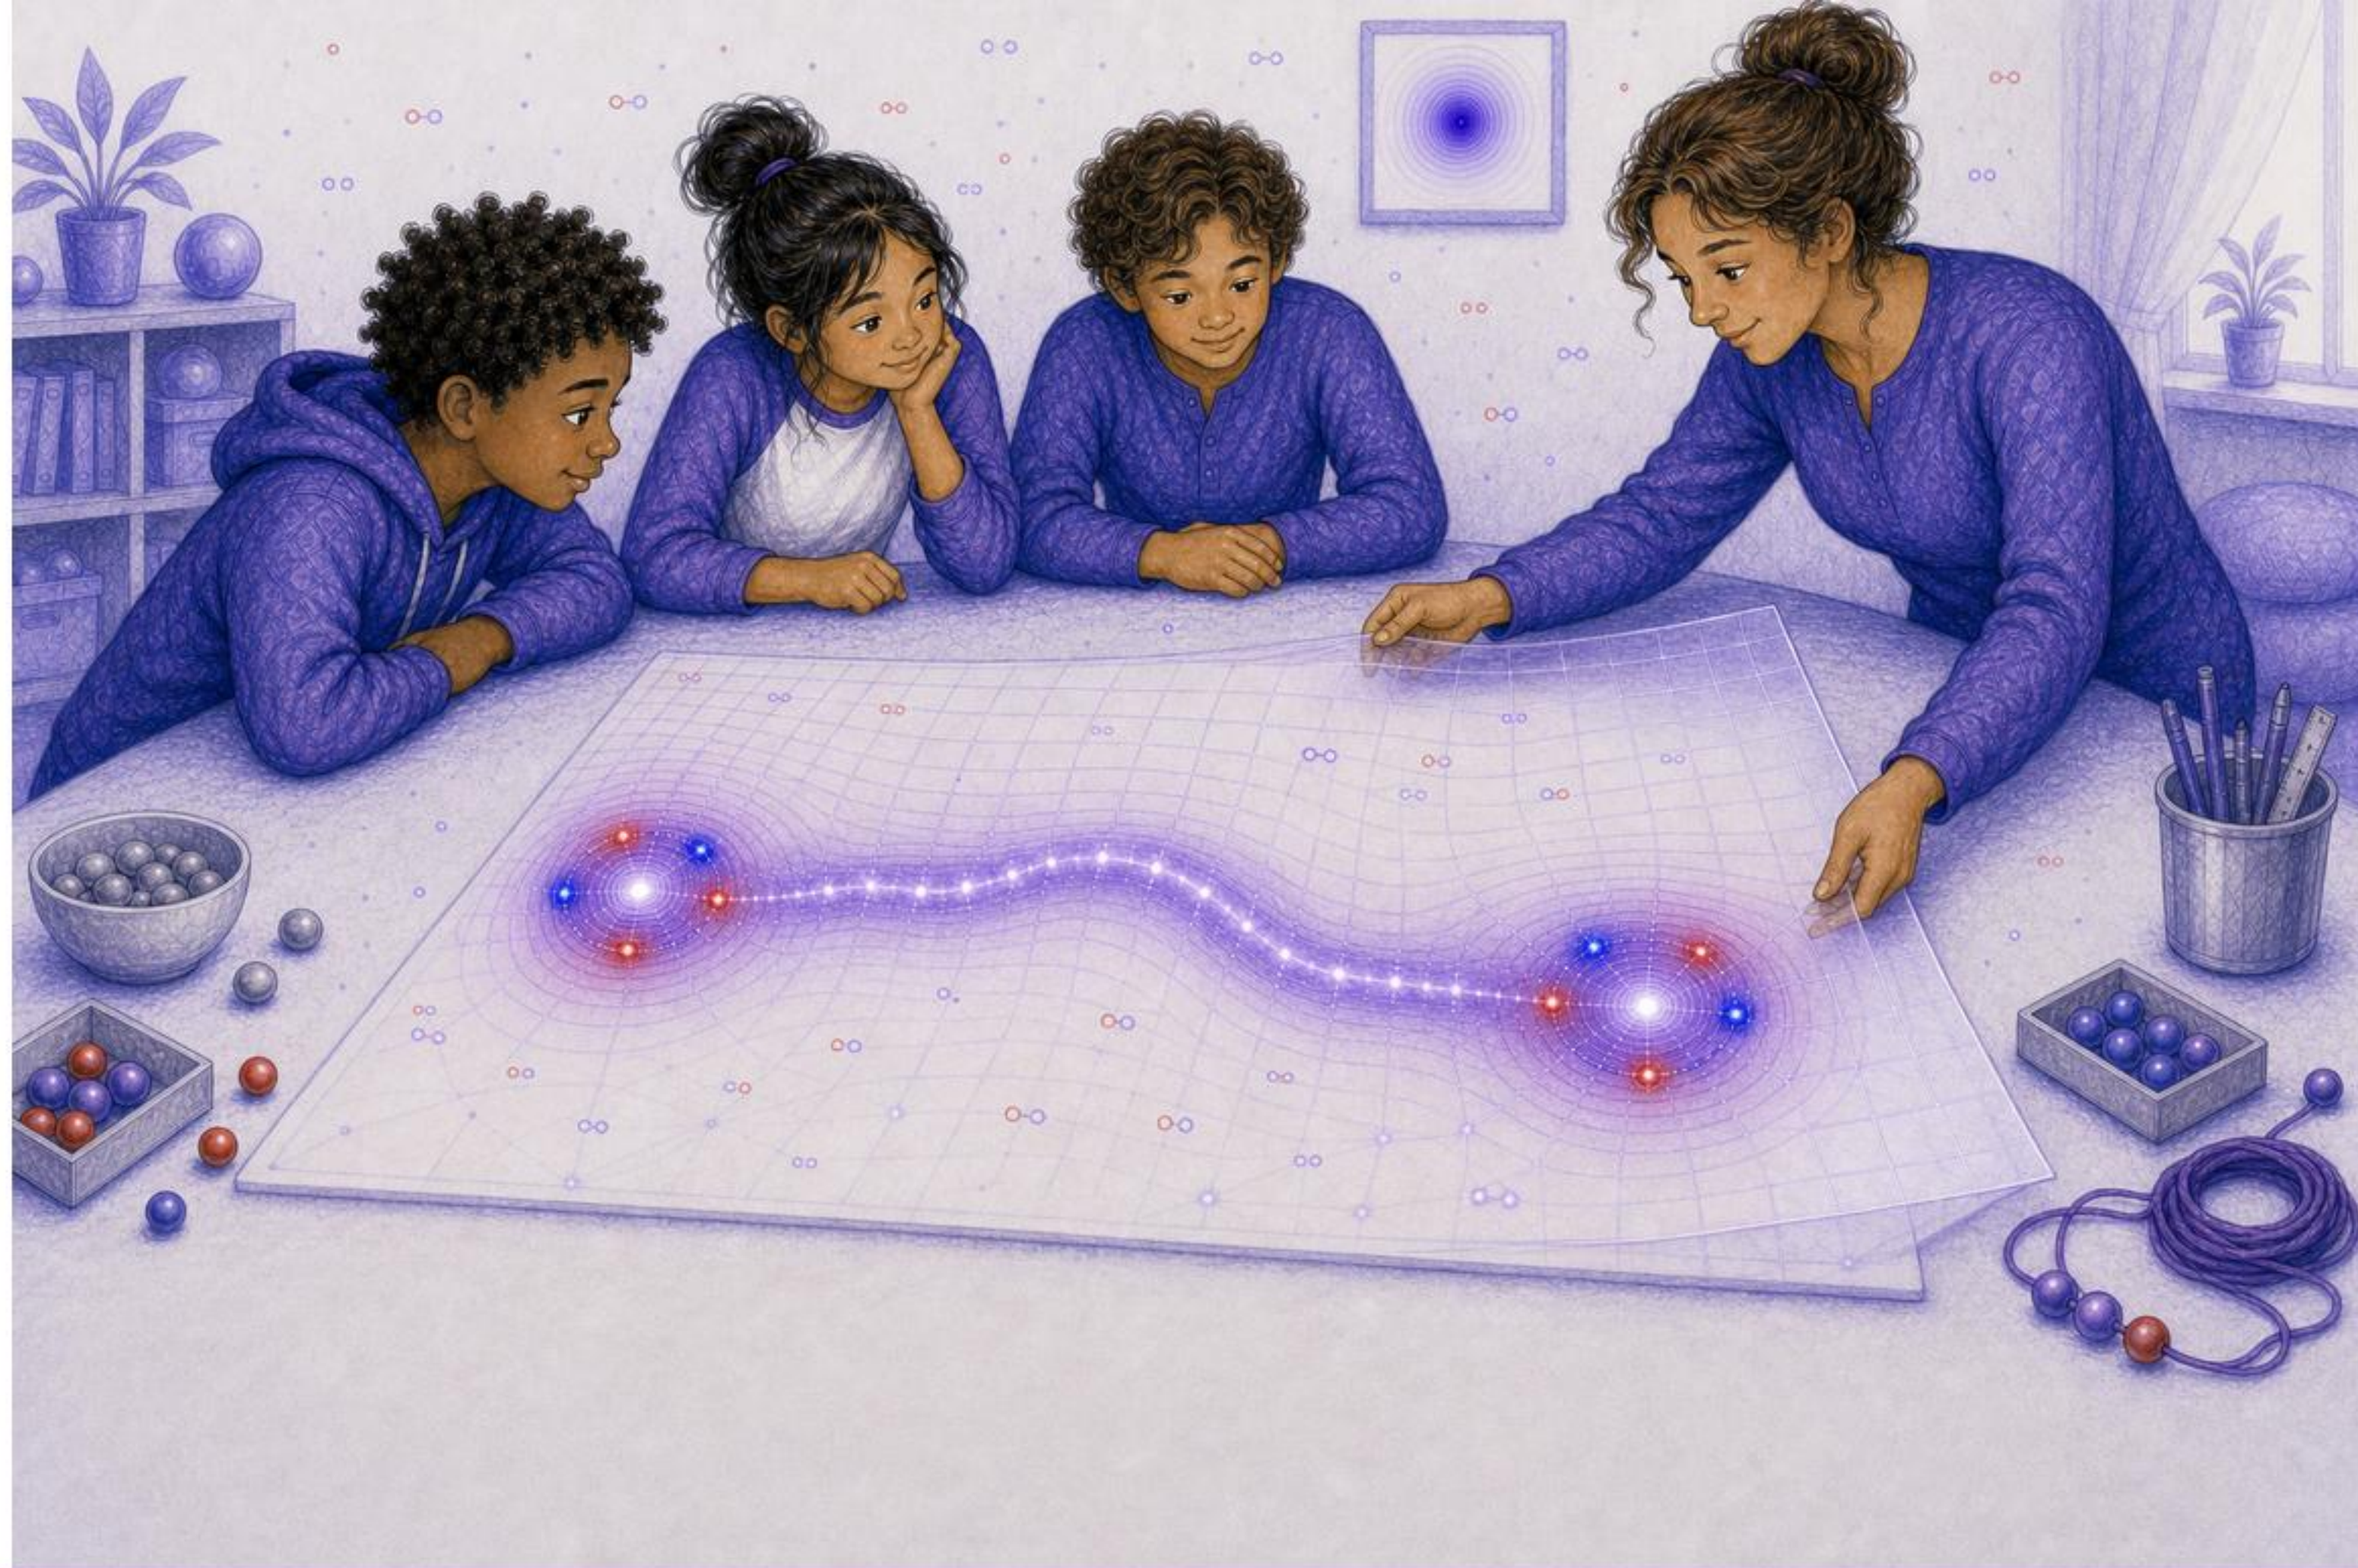

One assembly returned to its pattern again and again.
"That could become clocklike," Mira said.

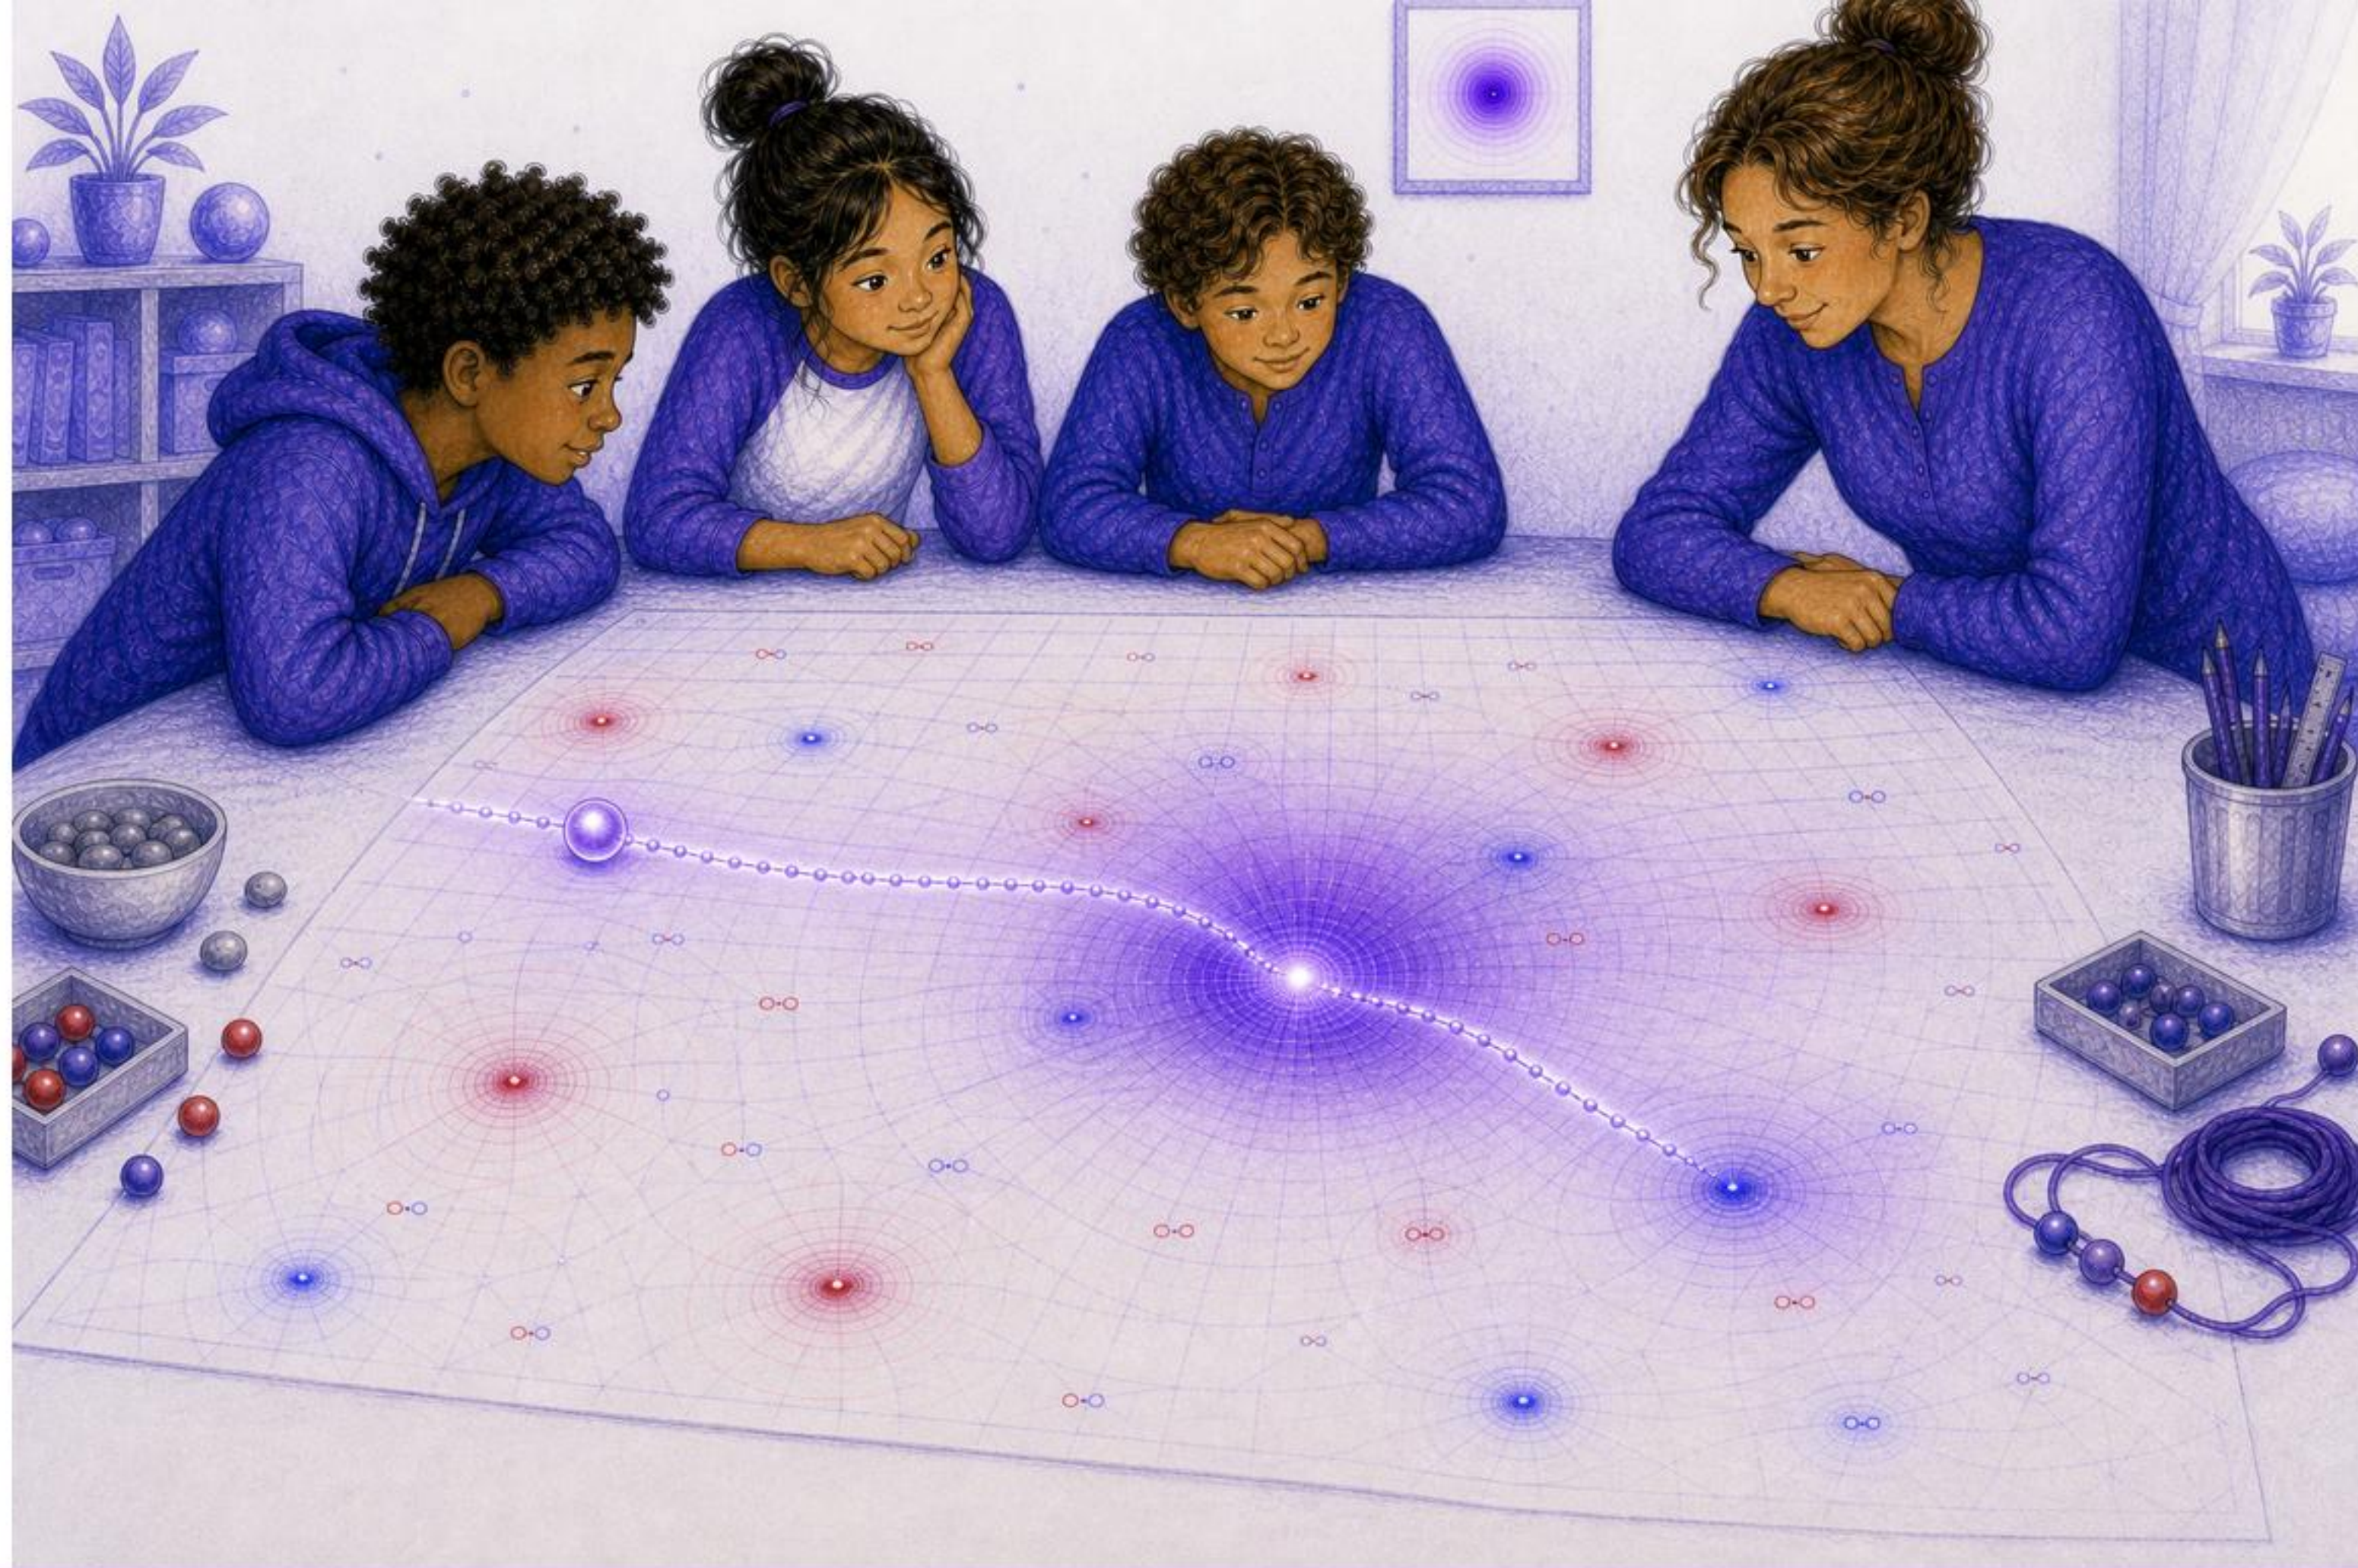

Another assembly kept a steady spacing.
"That could become rulerlike," Tomas said.

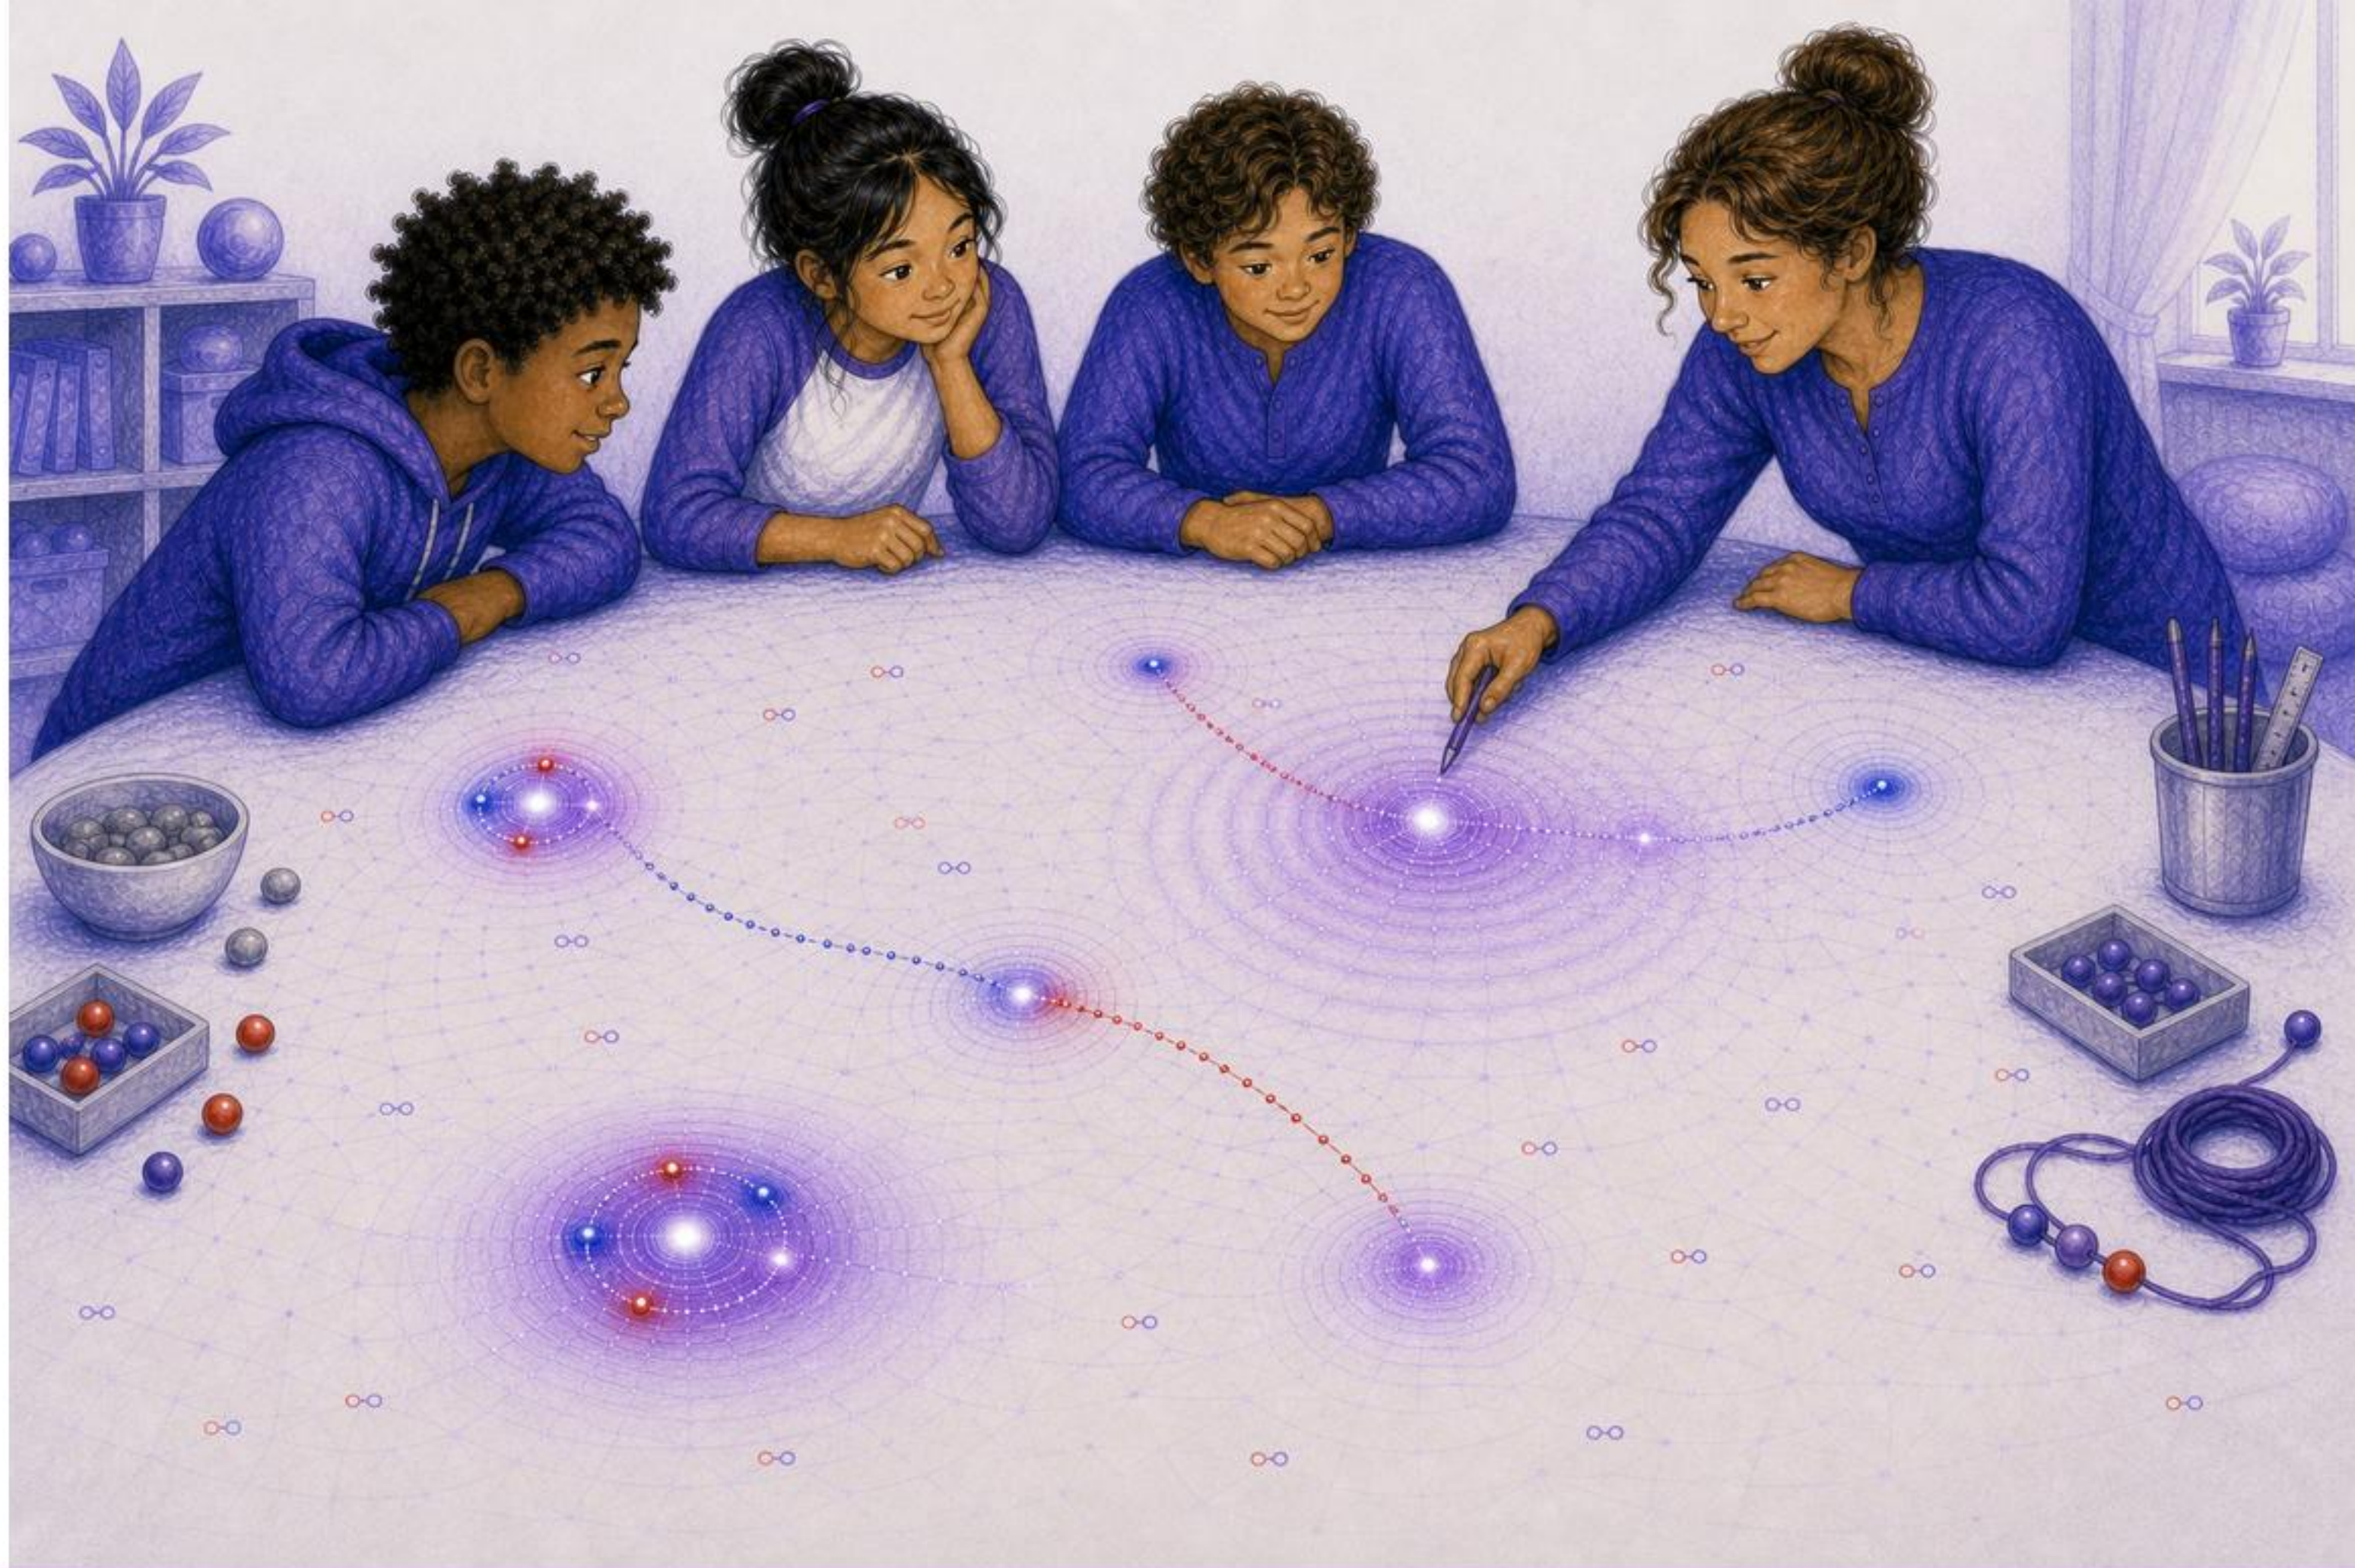

The channel carried a bright response.
It crossed the table without becoming a little ball.

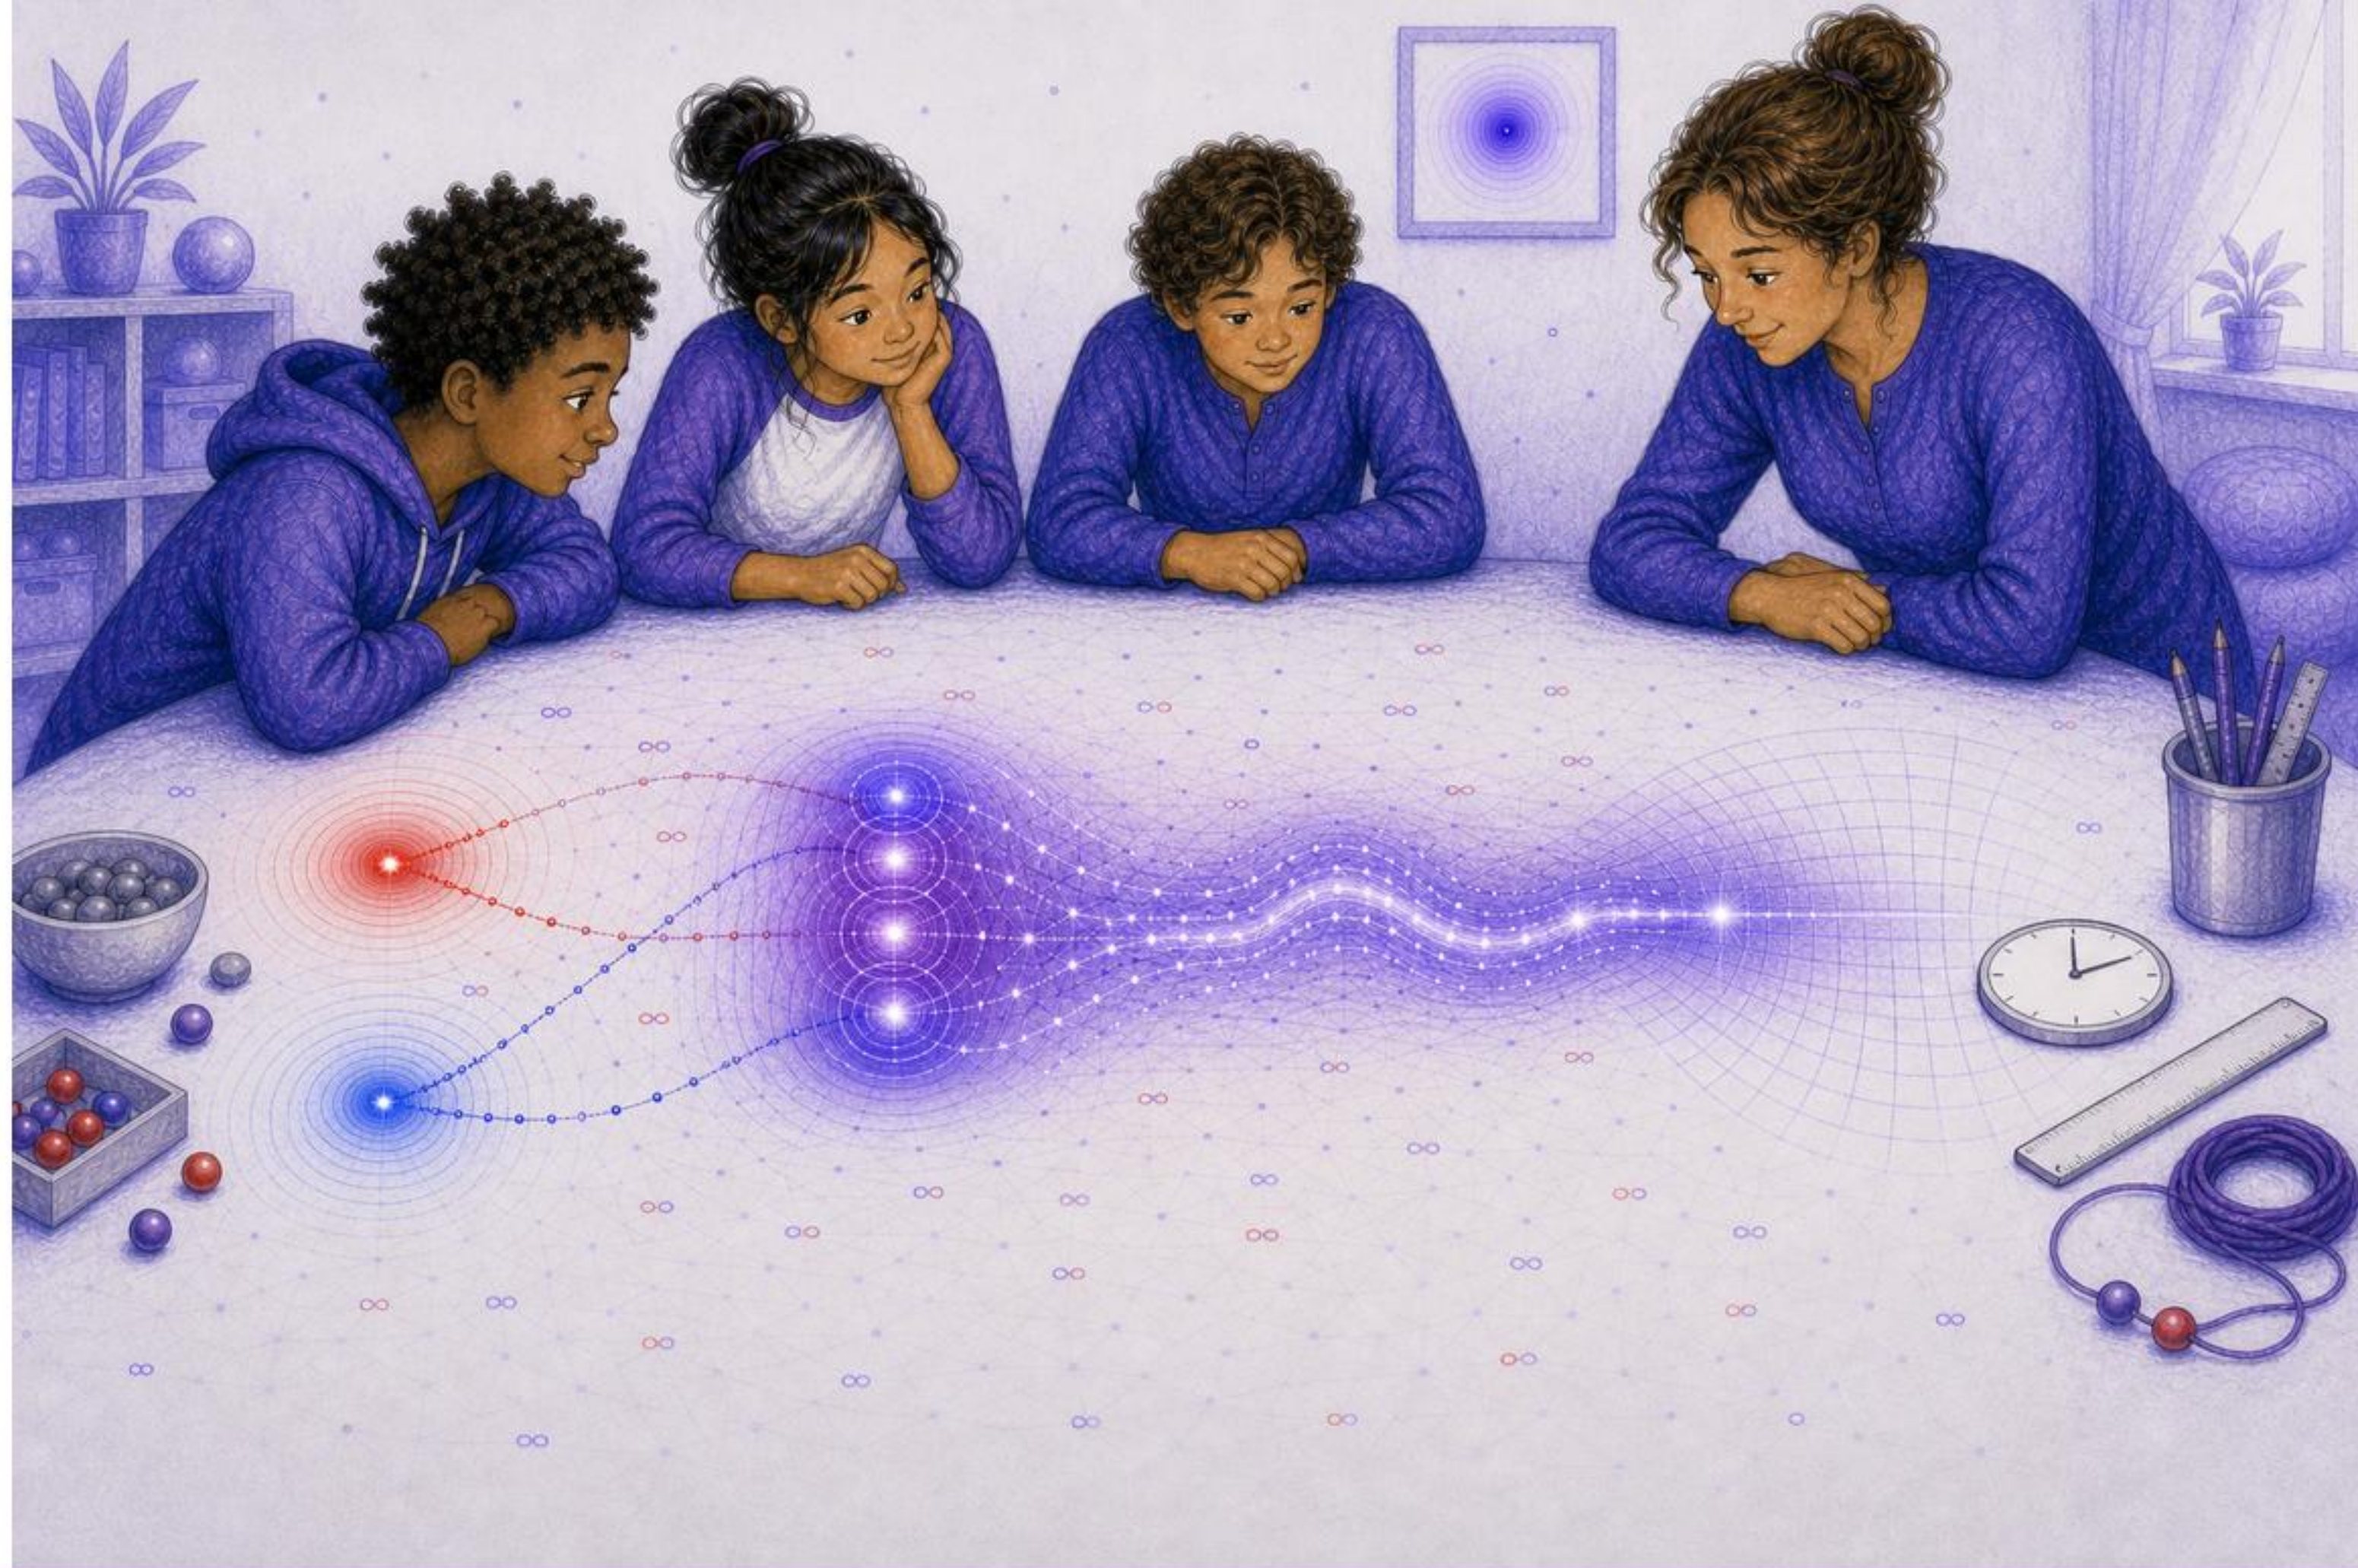

Dr. Sol laid a soft grid over the scene.
The grid was not the deepest thing.
It helped describe what larger travelers would see.

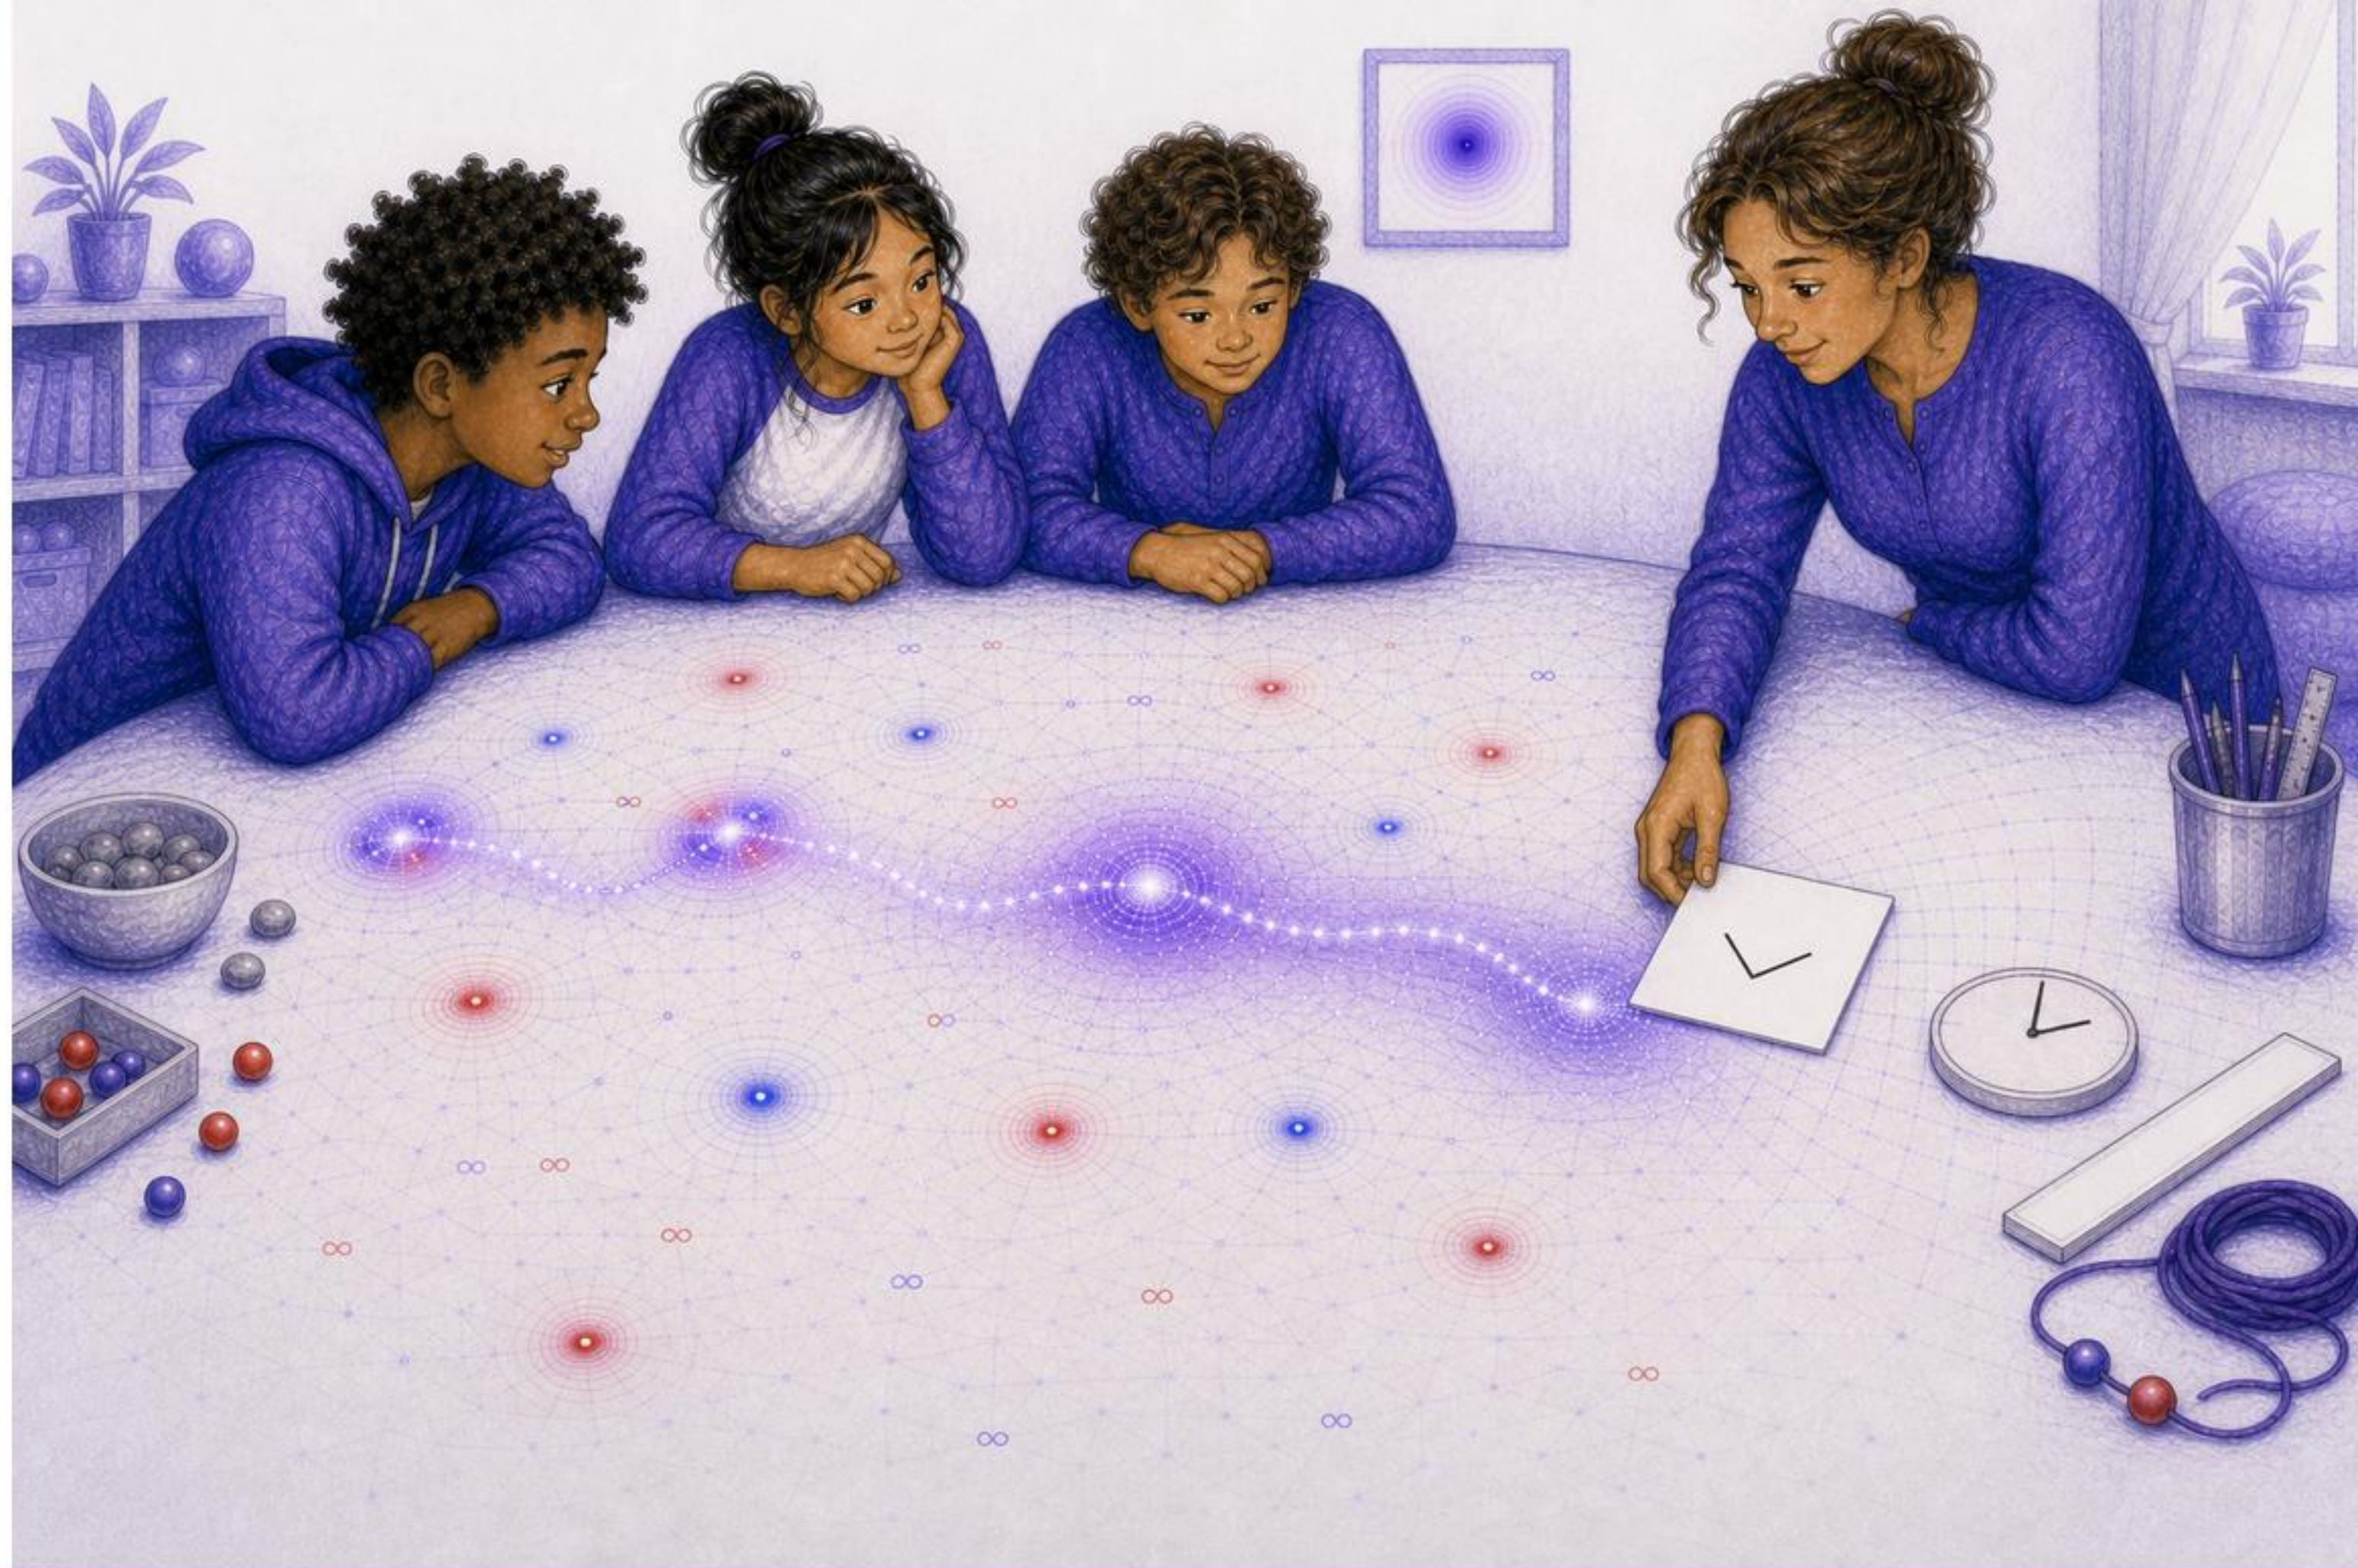

A larger bead crossed the grid.
Its path bent where the medium changed.

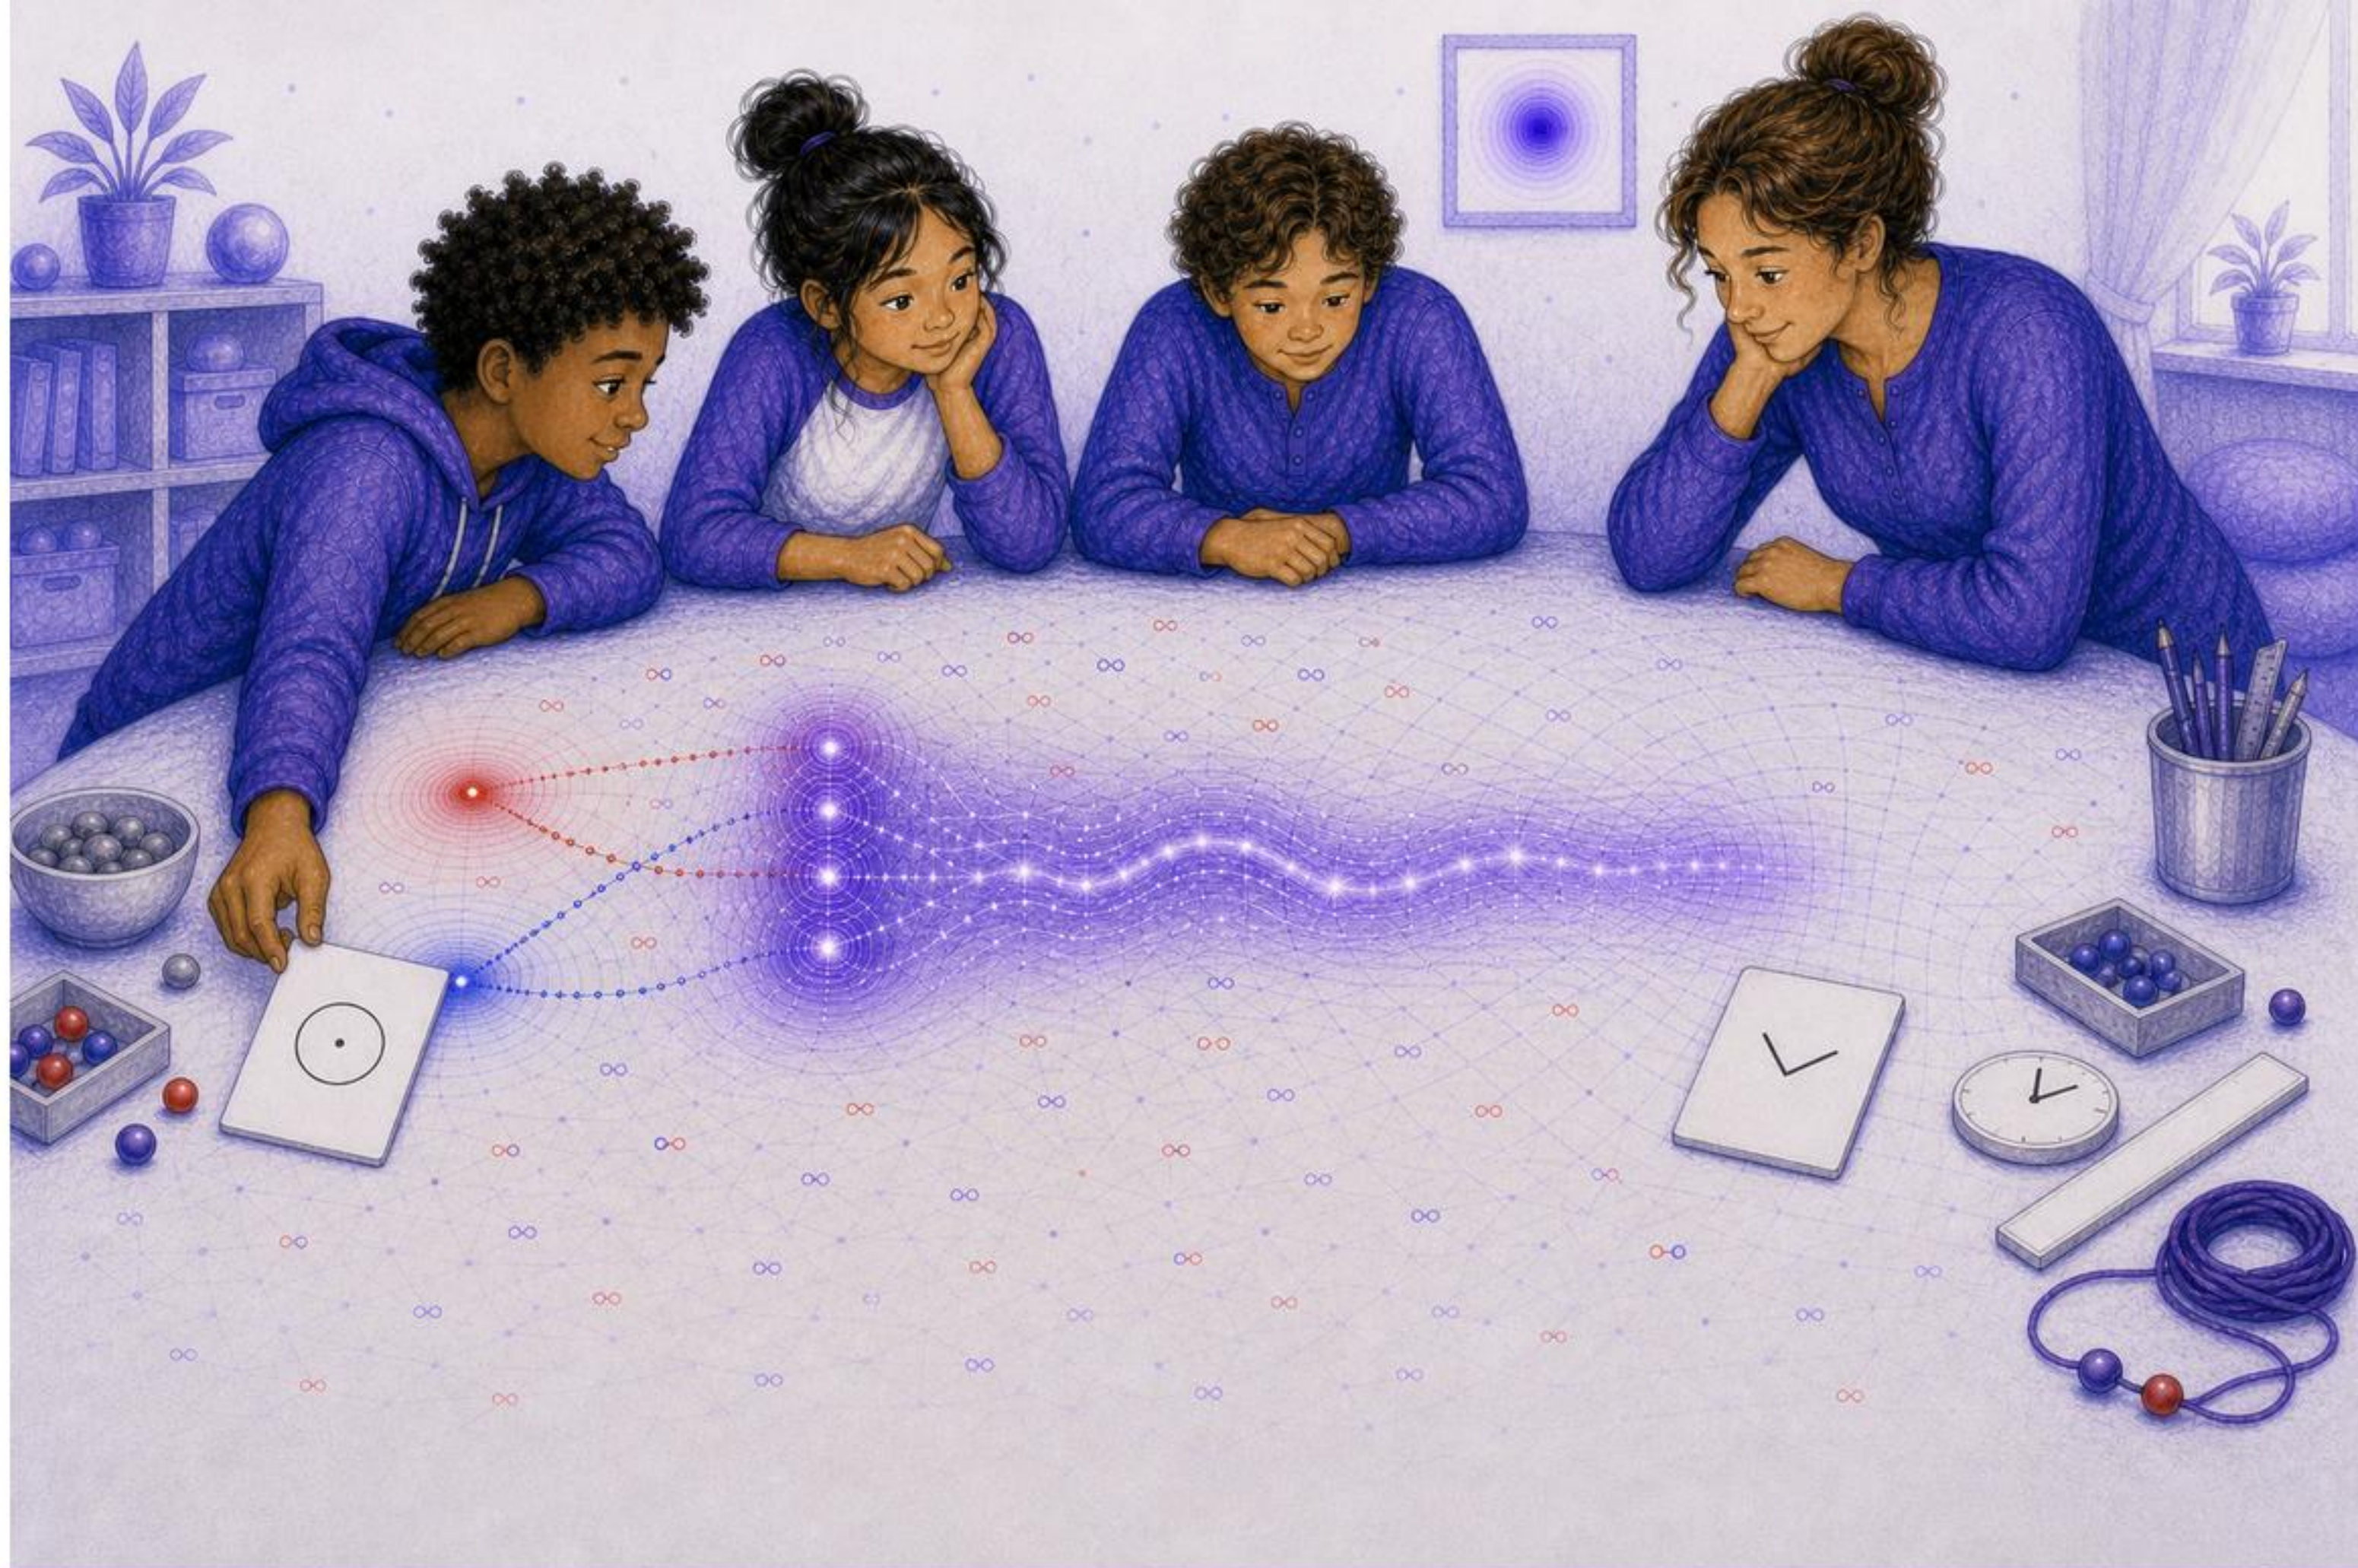

"Why do some patterns resist change more?" Ari asked.
Dr. Sol smiled.
"That is a mass-map question."

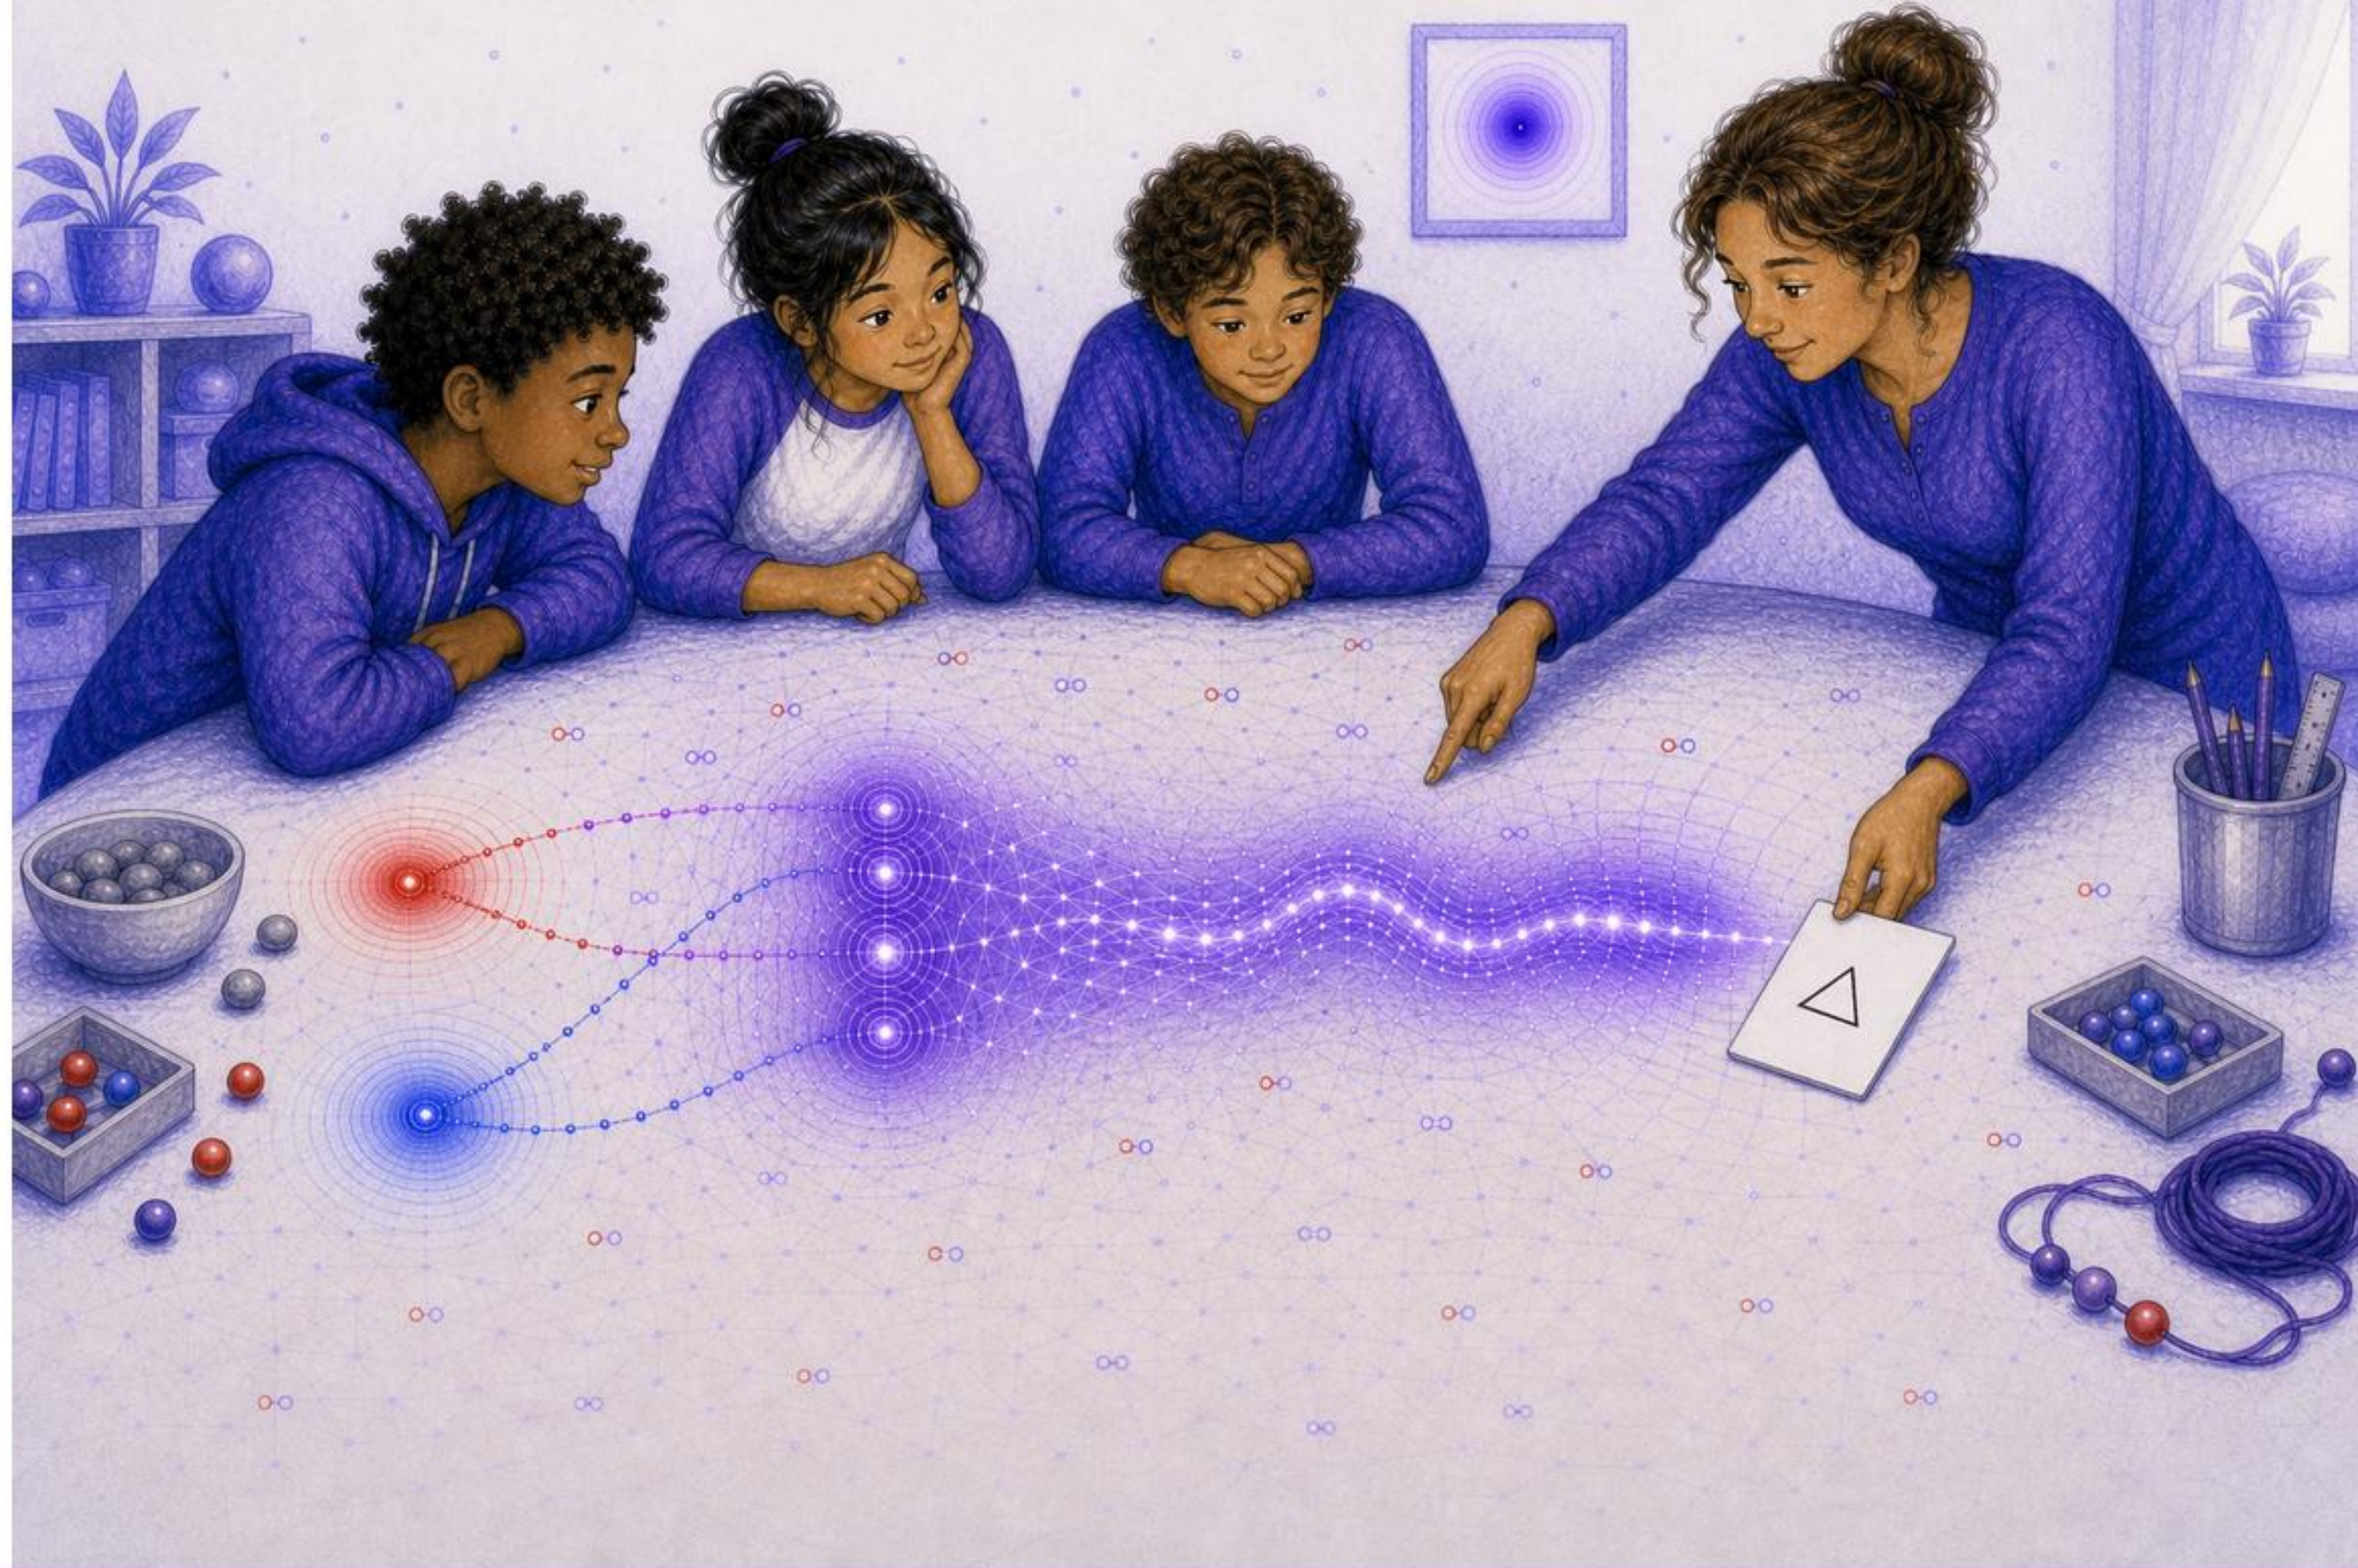

Clocks.
Rulers.
Light paths.
Curved motion.
They all belonged at the recovered end of the table.

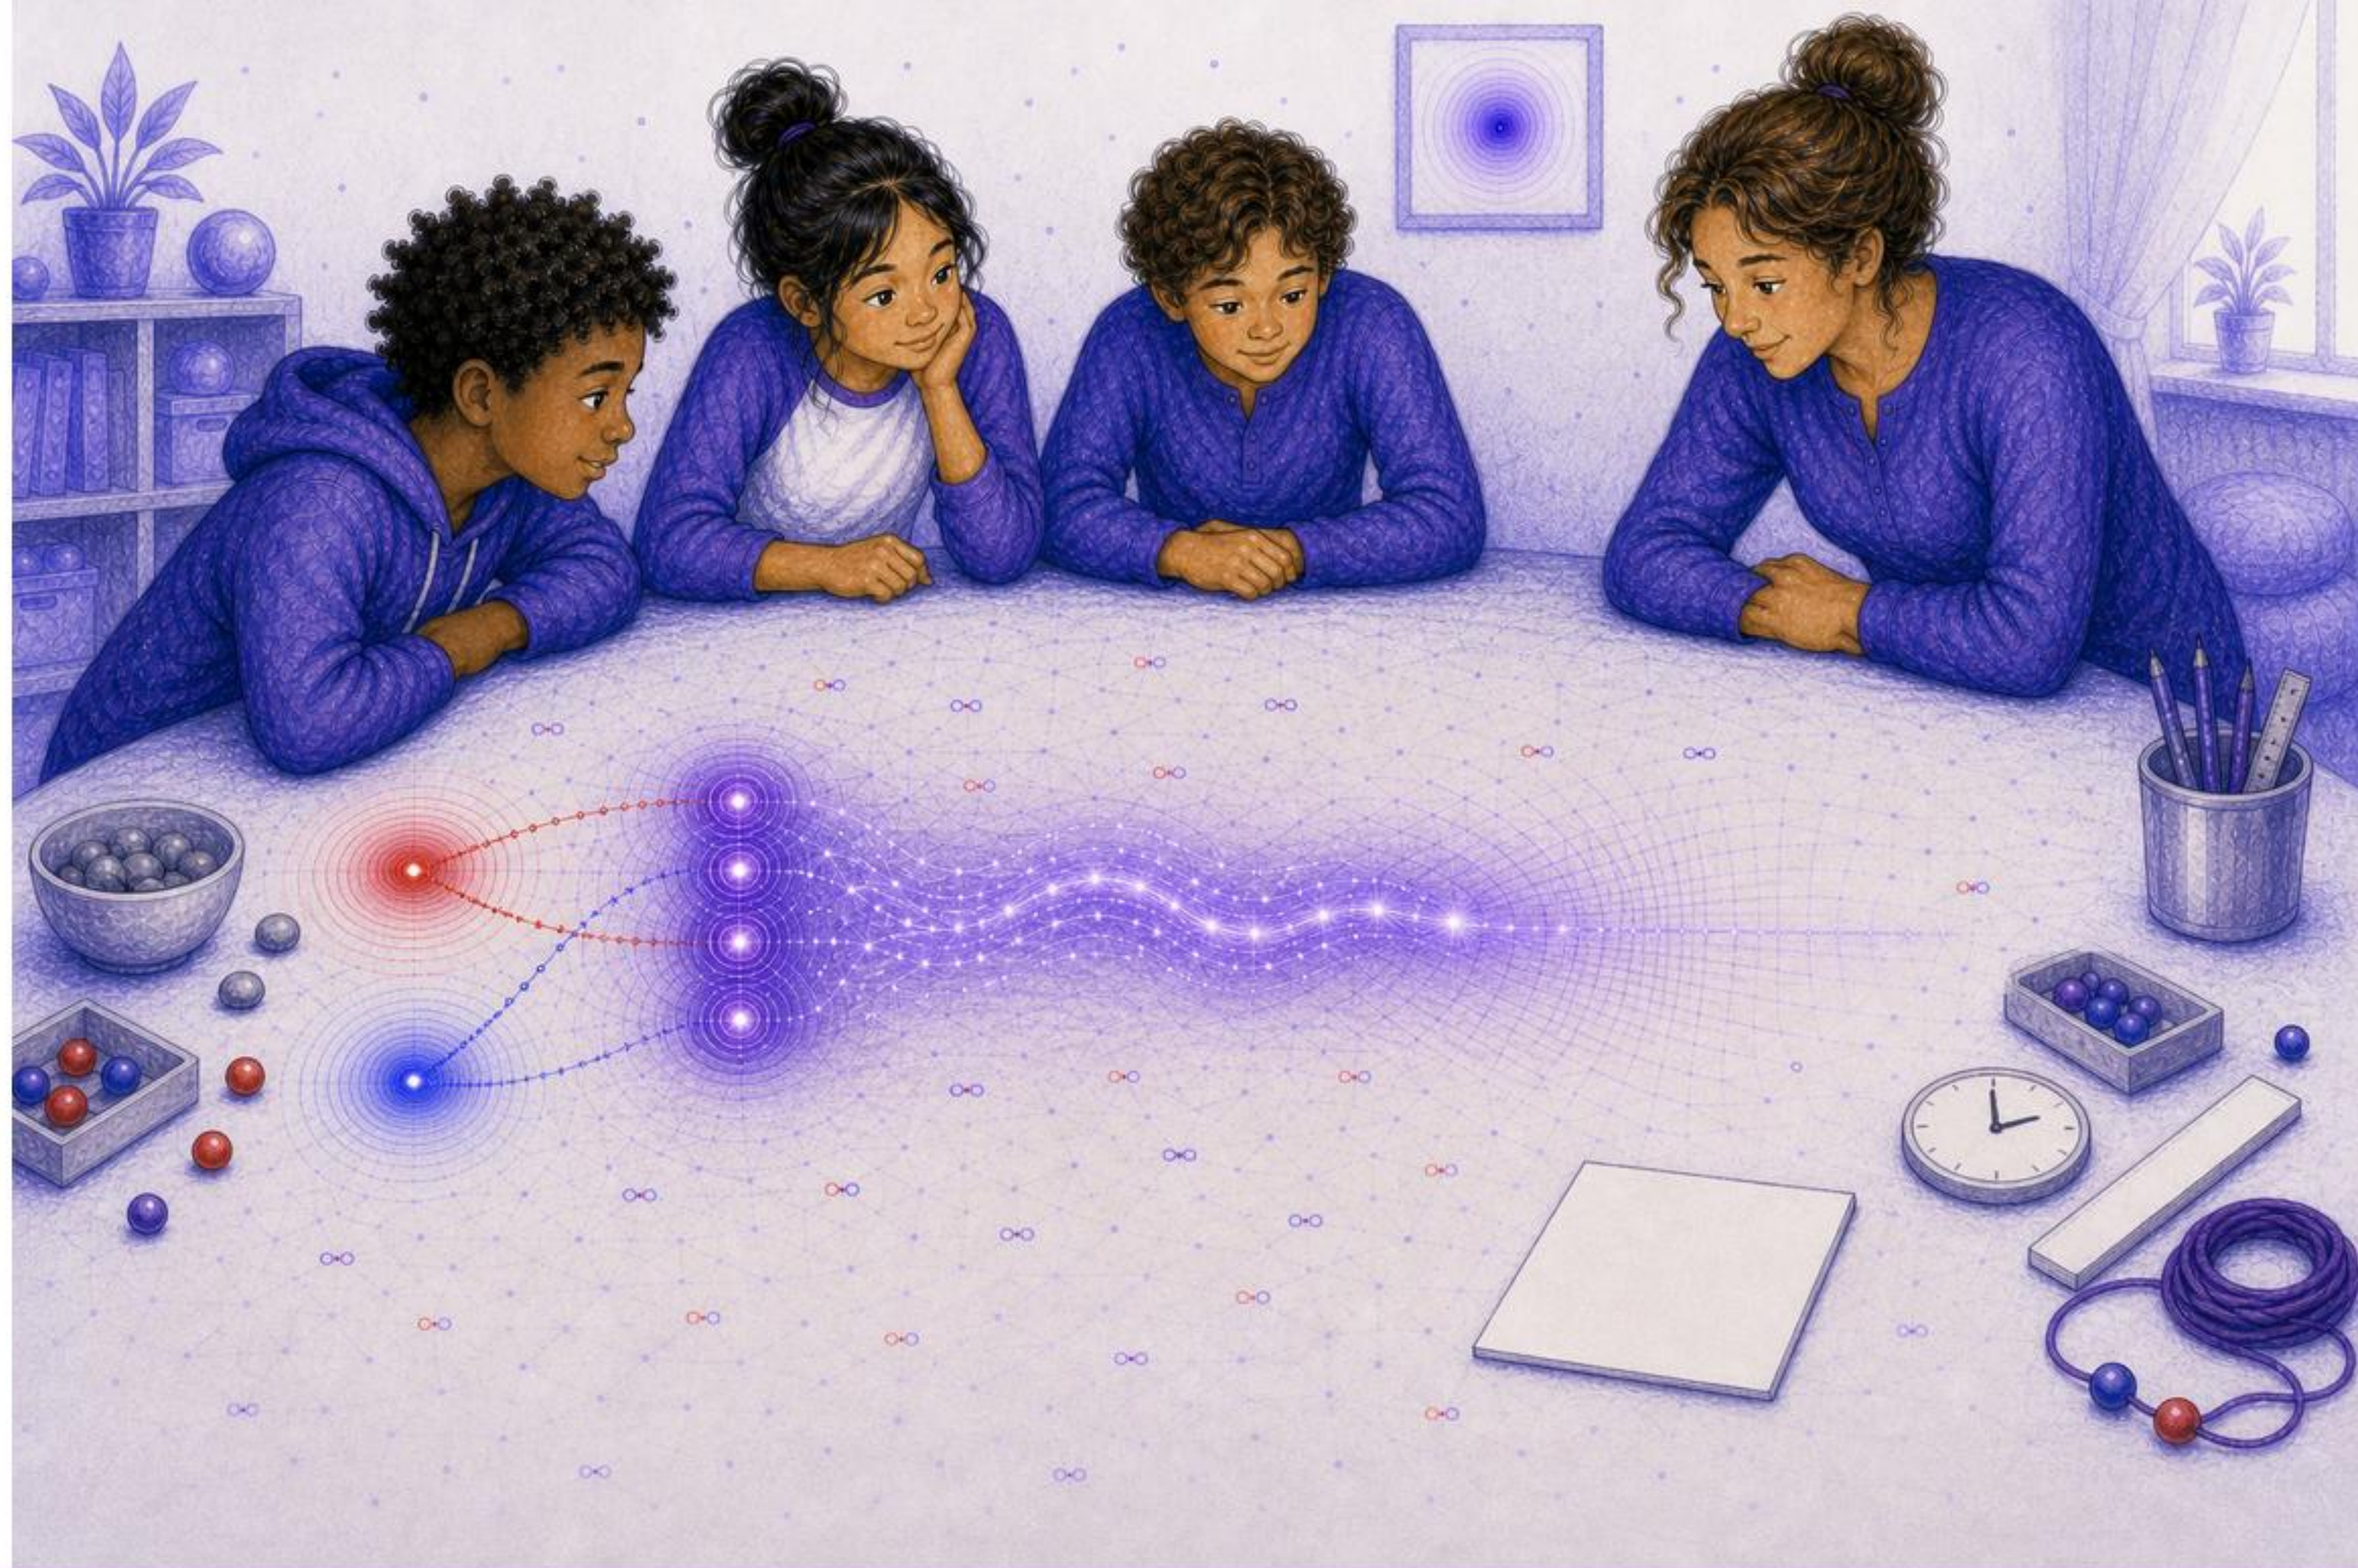

Mira placed one blank card by the clock.
"Some things are observed."

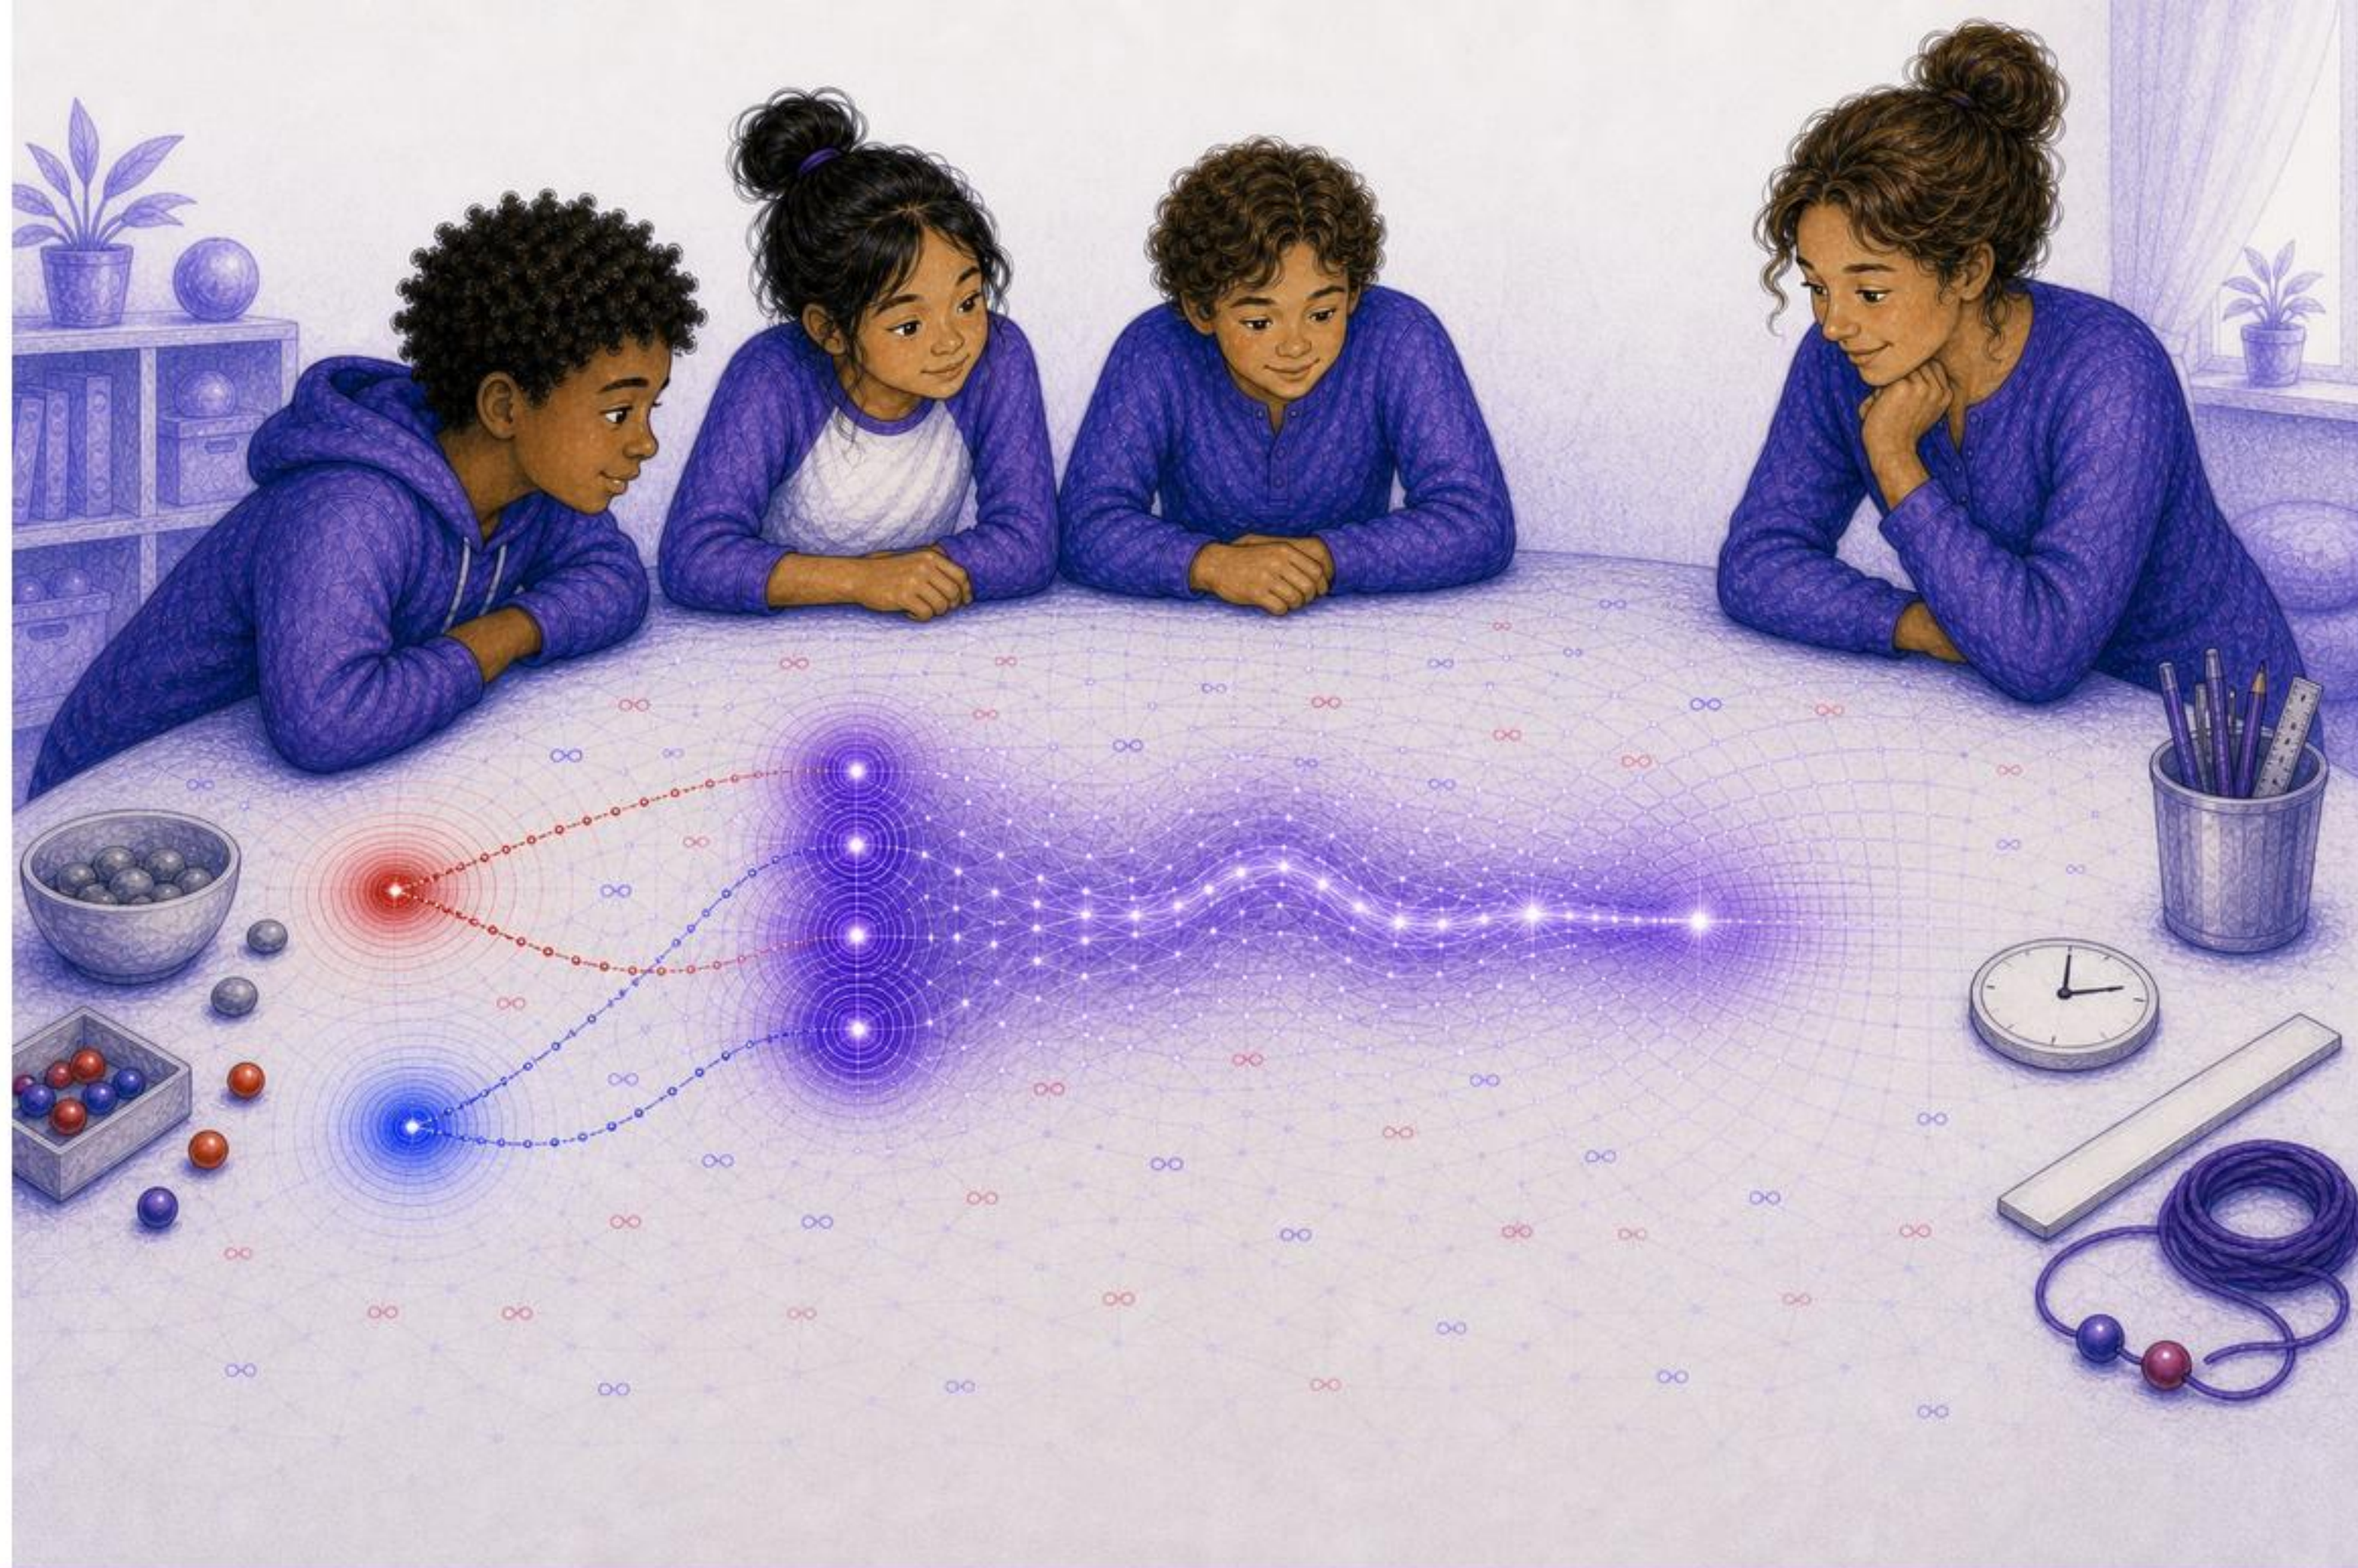

Tomas placed another blank card by the model.
"Some things are simulated."

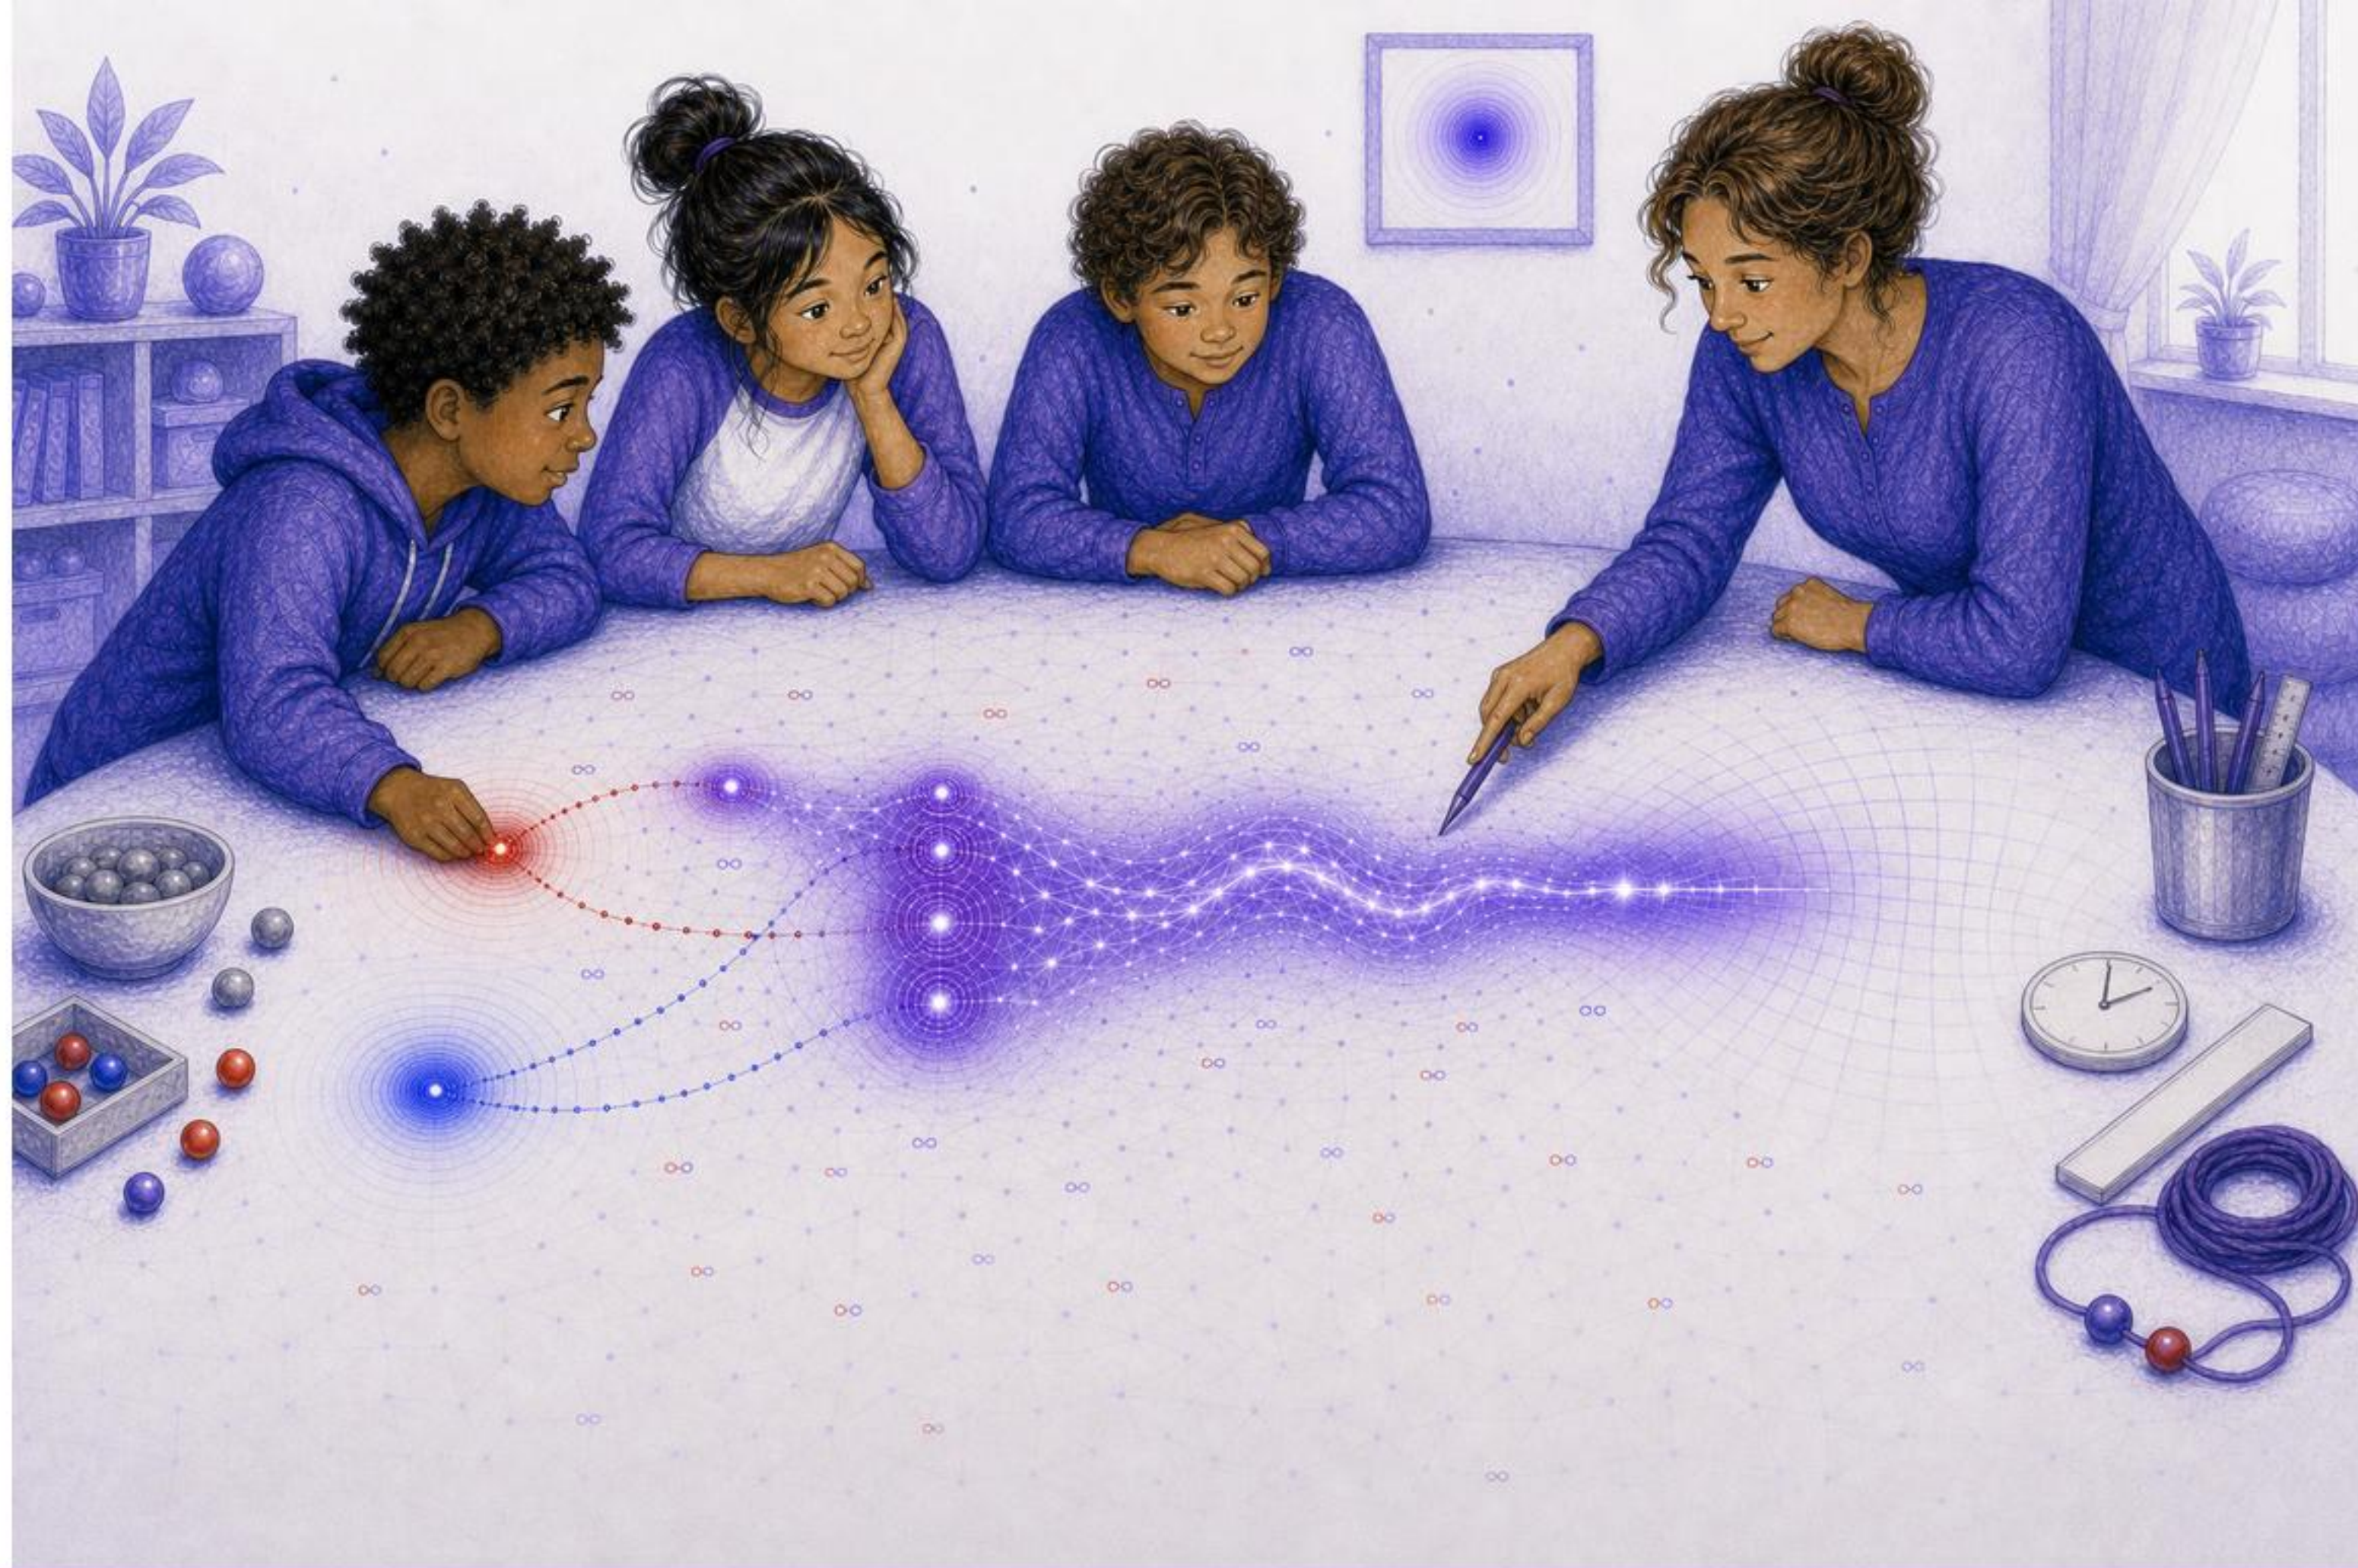

Ari placed a third blank card by the path.
"Some things must be derived."

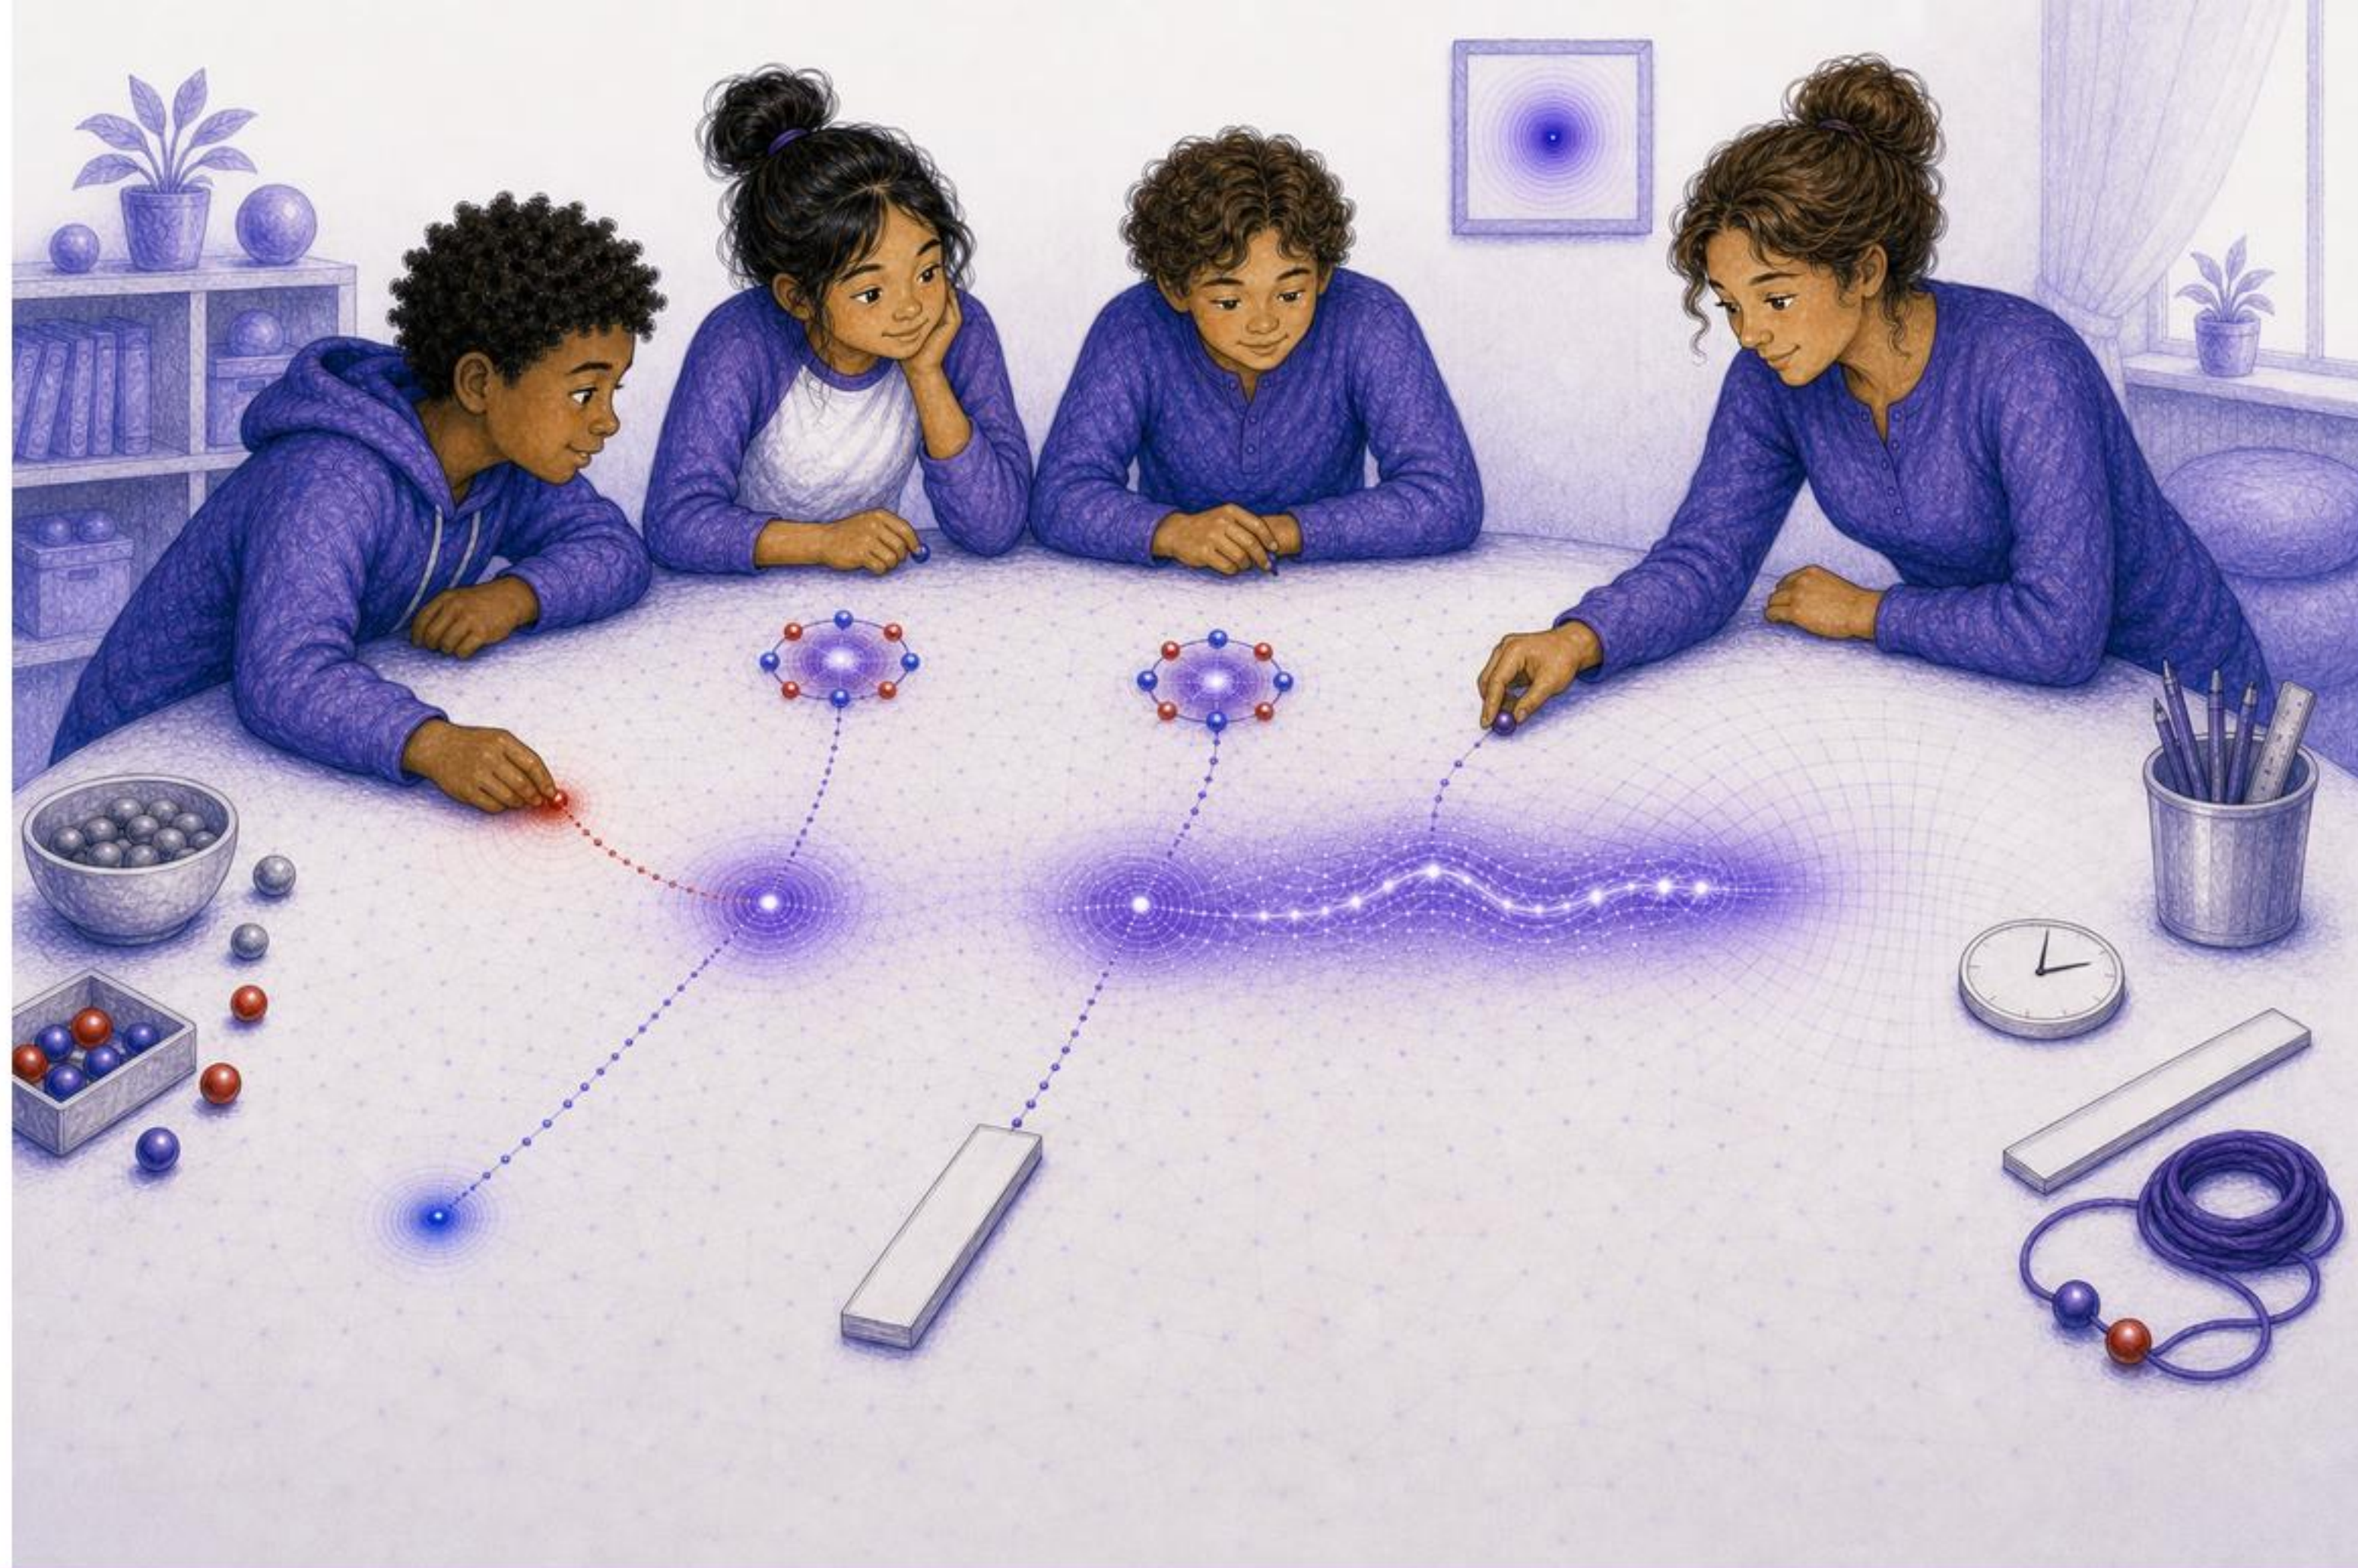

Dr. Sol left one card empty.
"Some things are still open."

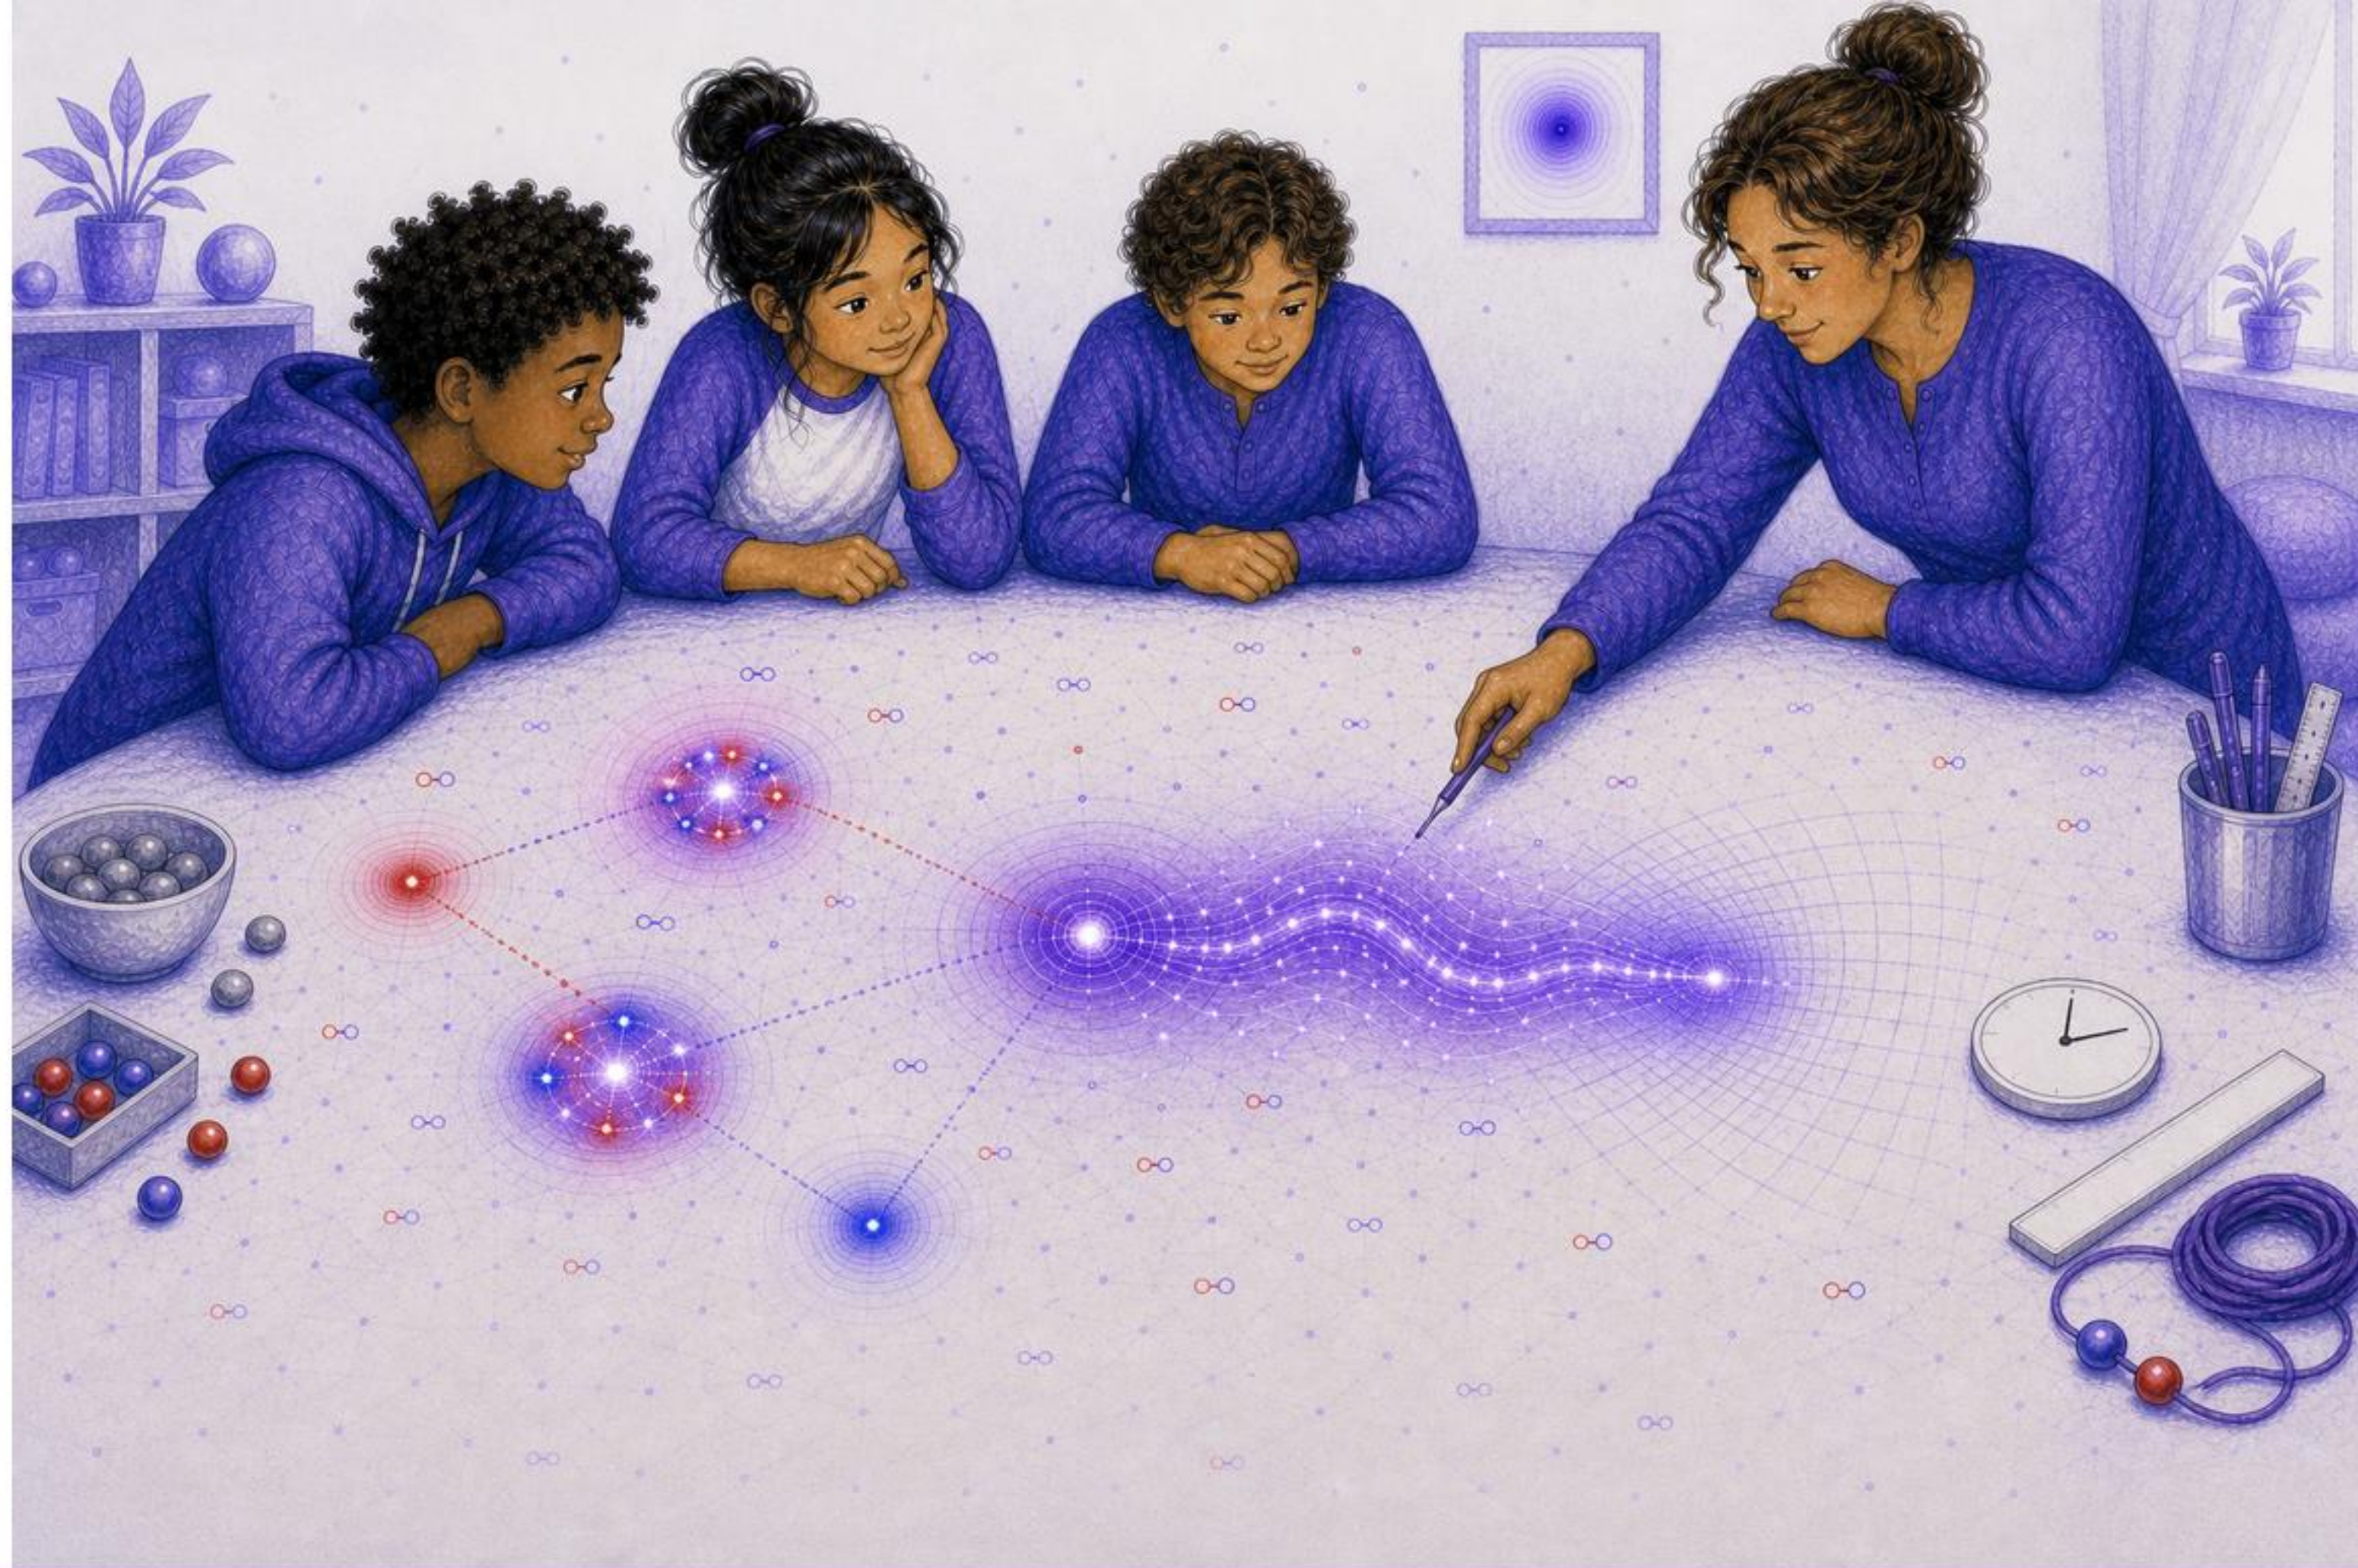

"If this architecture is right," Mira said,
"it must recover the world we measure."

The familiar world was not ignored.
It was waiting at the end of the work.
Now they knew what had to be recovered.

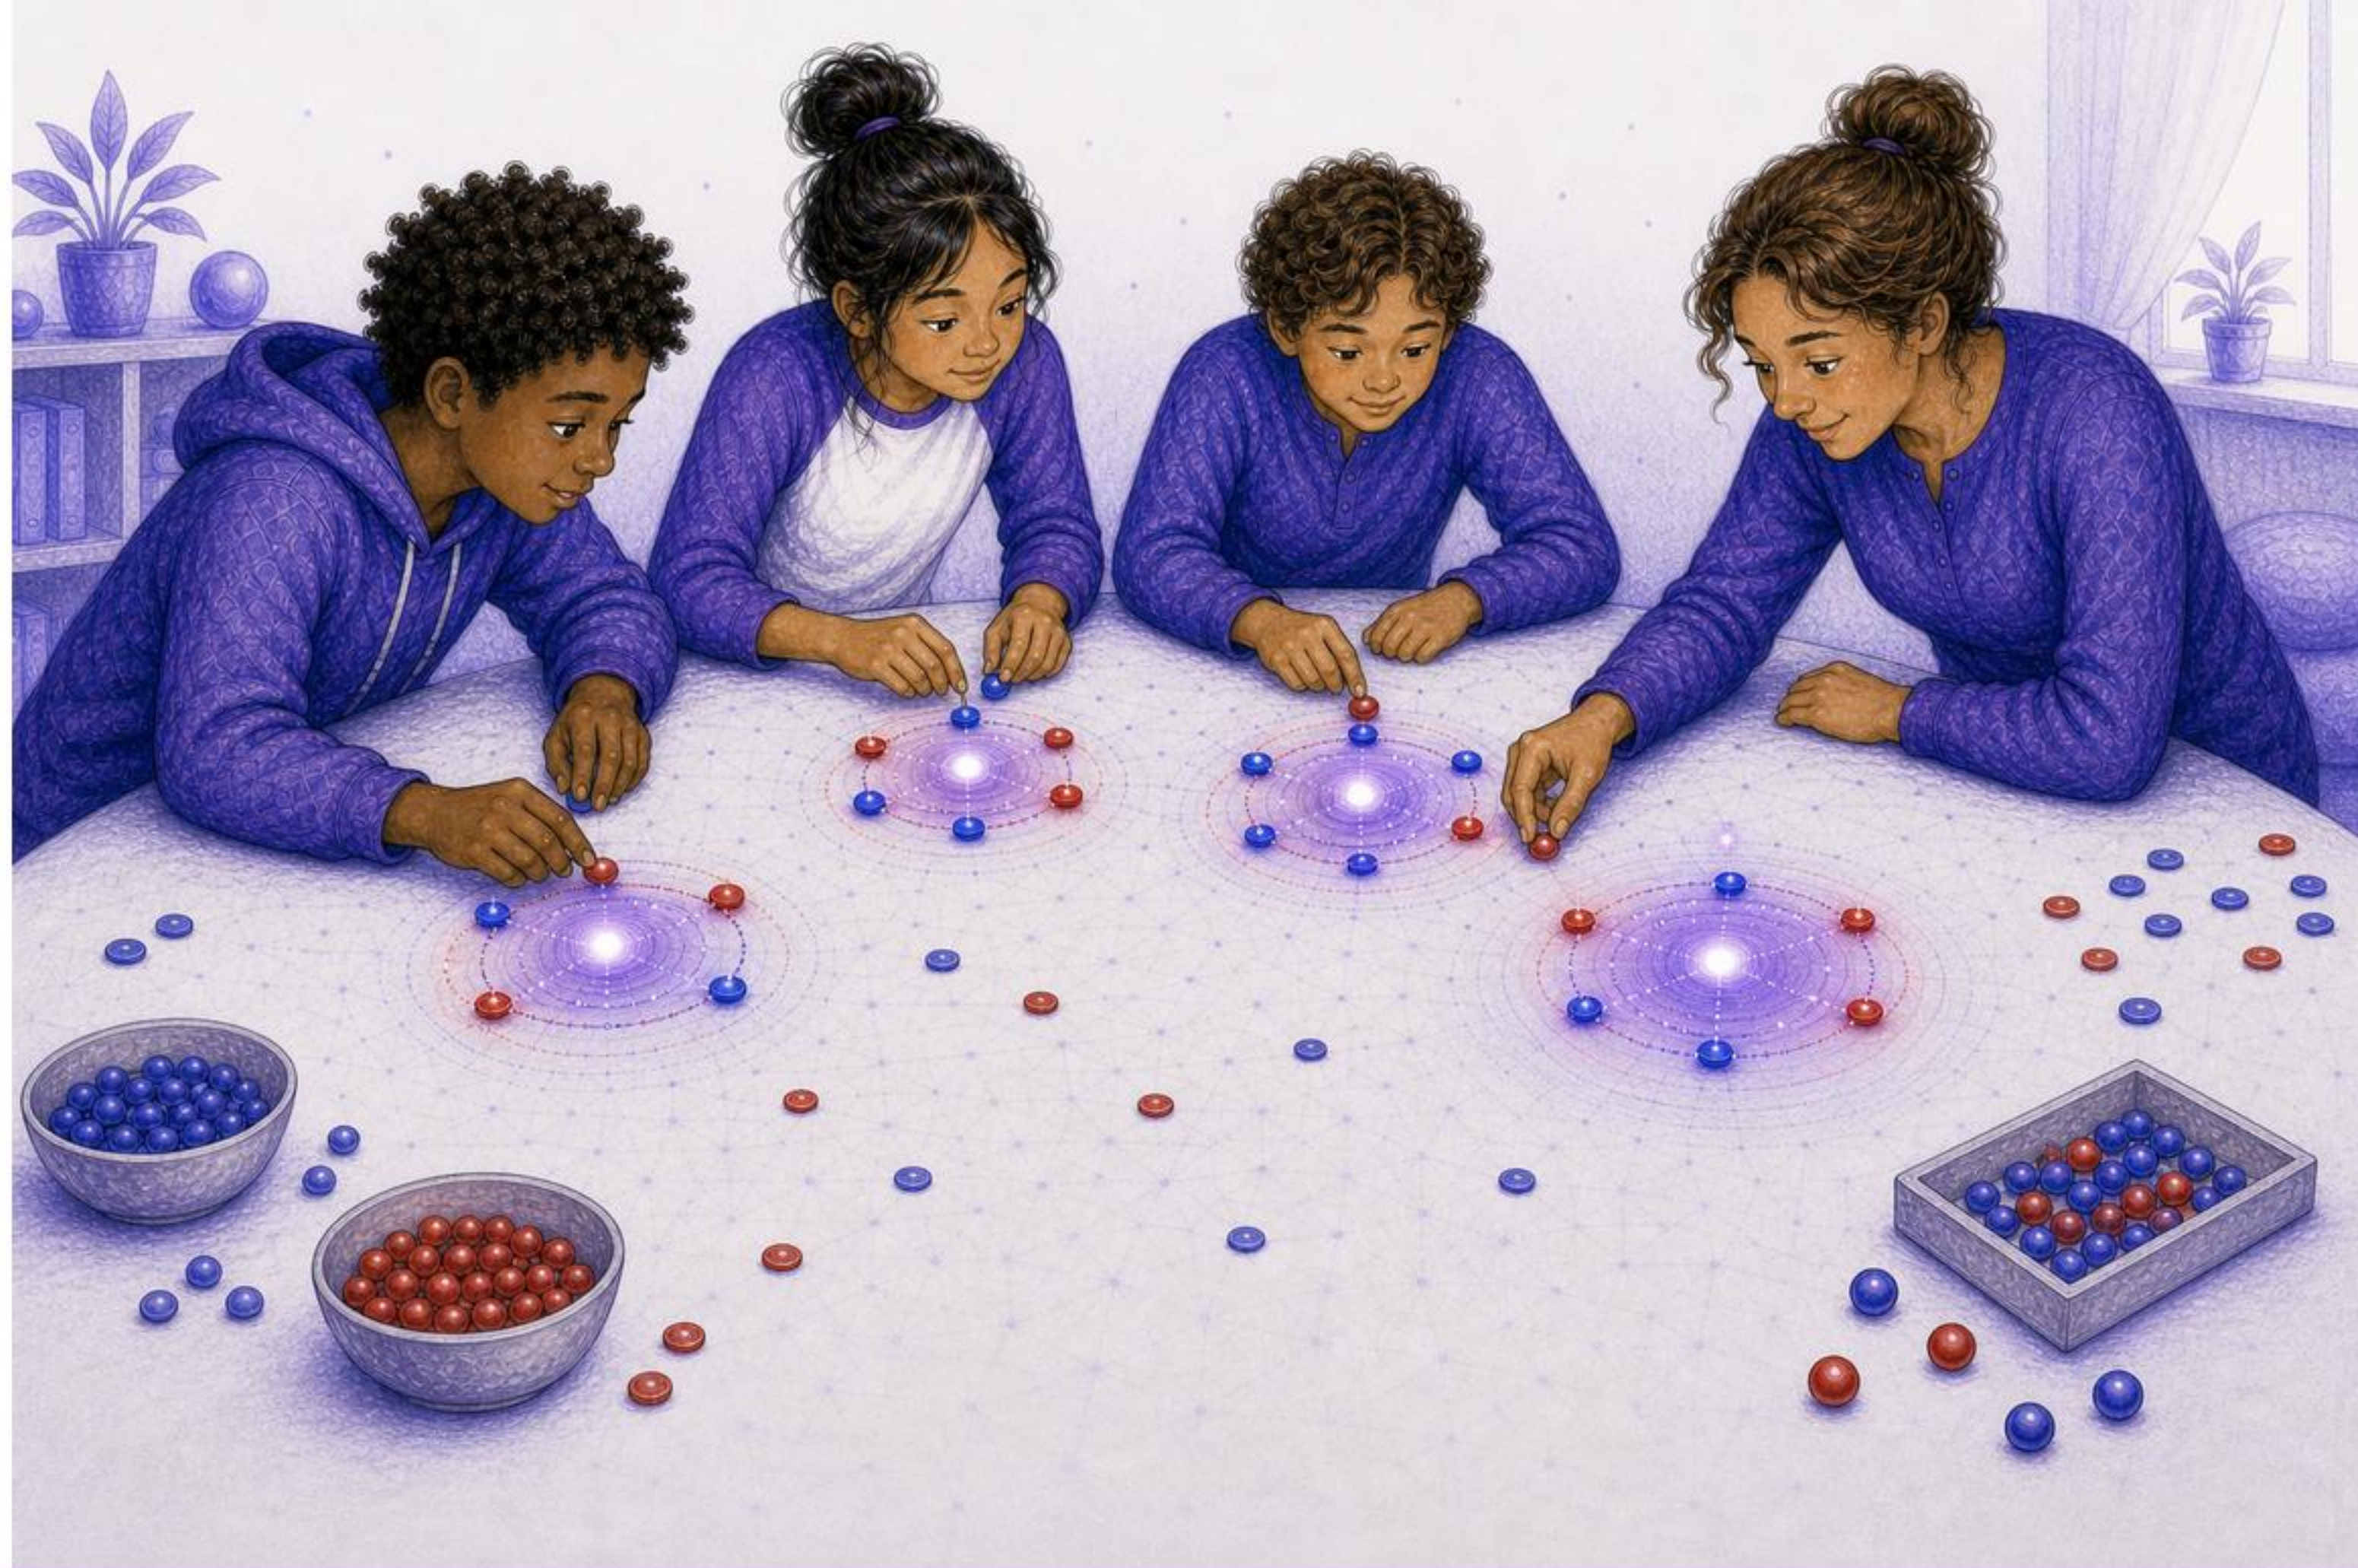

Assemblies can build higher-level clocks, rulers, and channels.

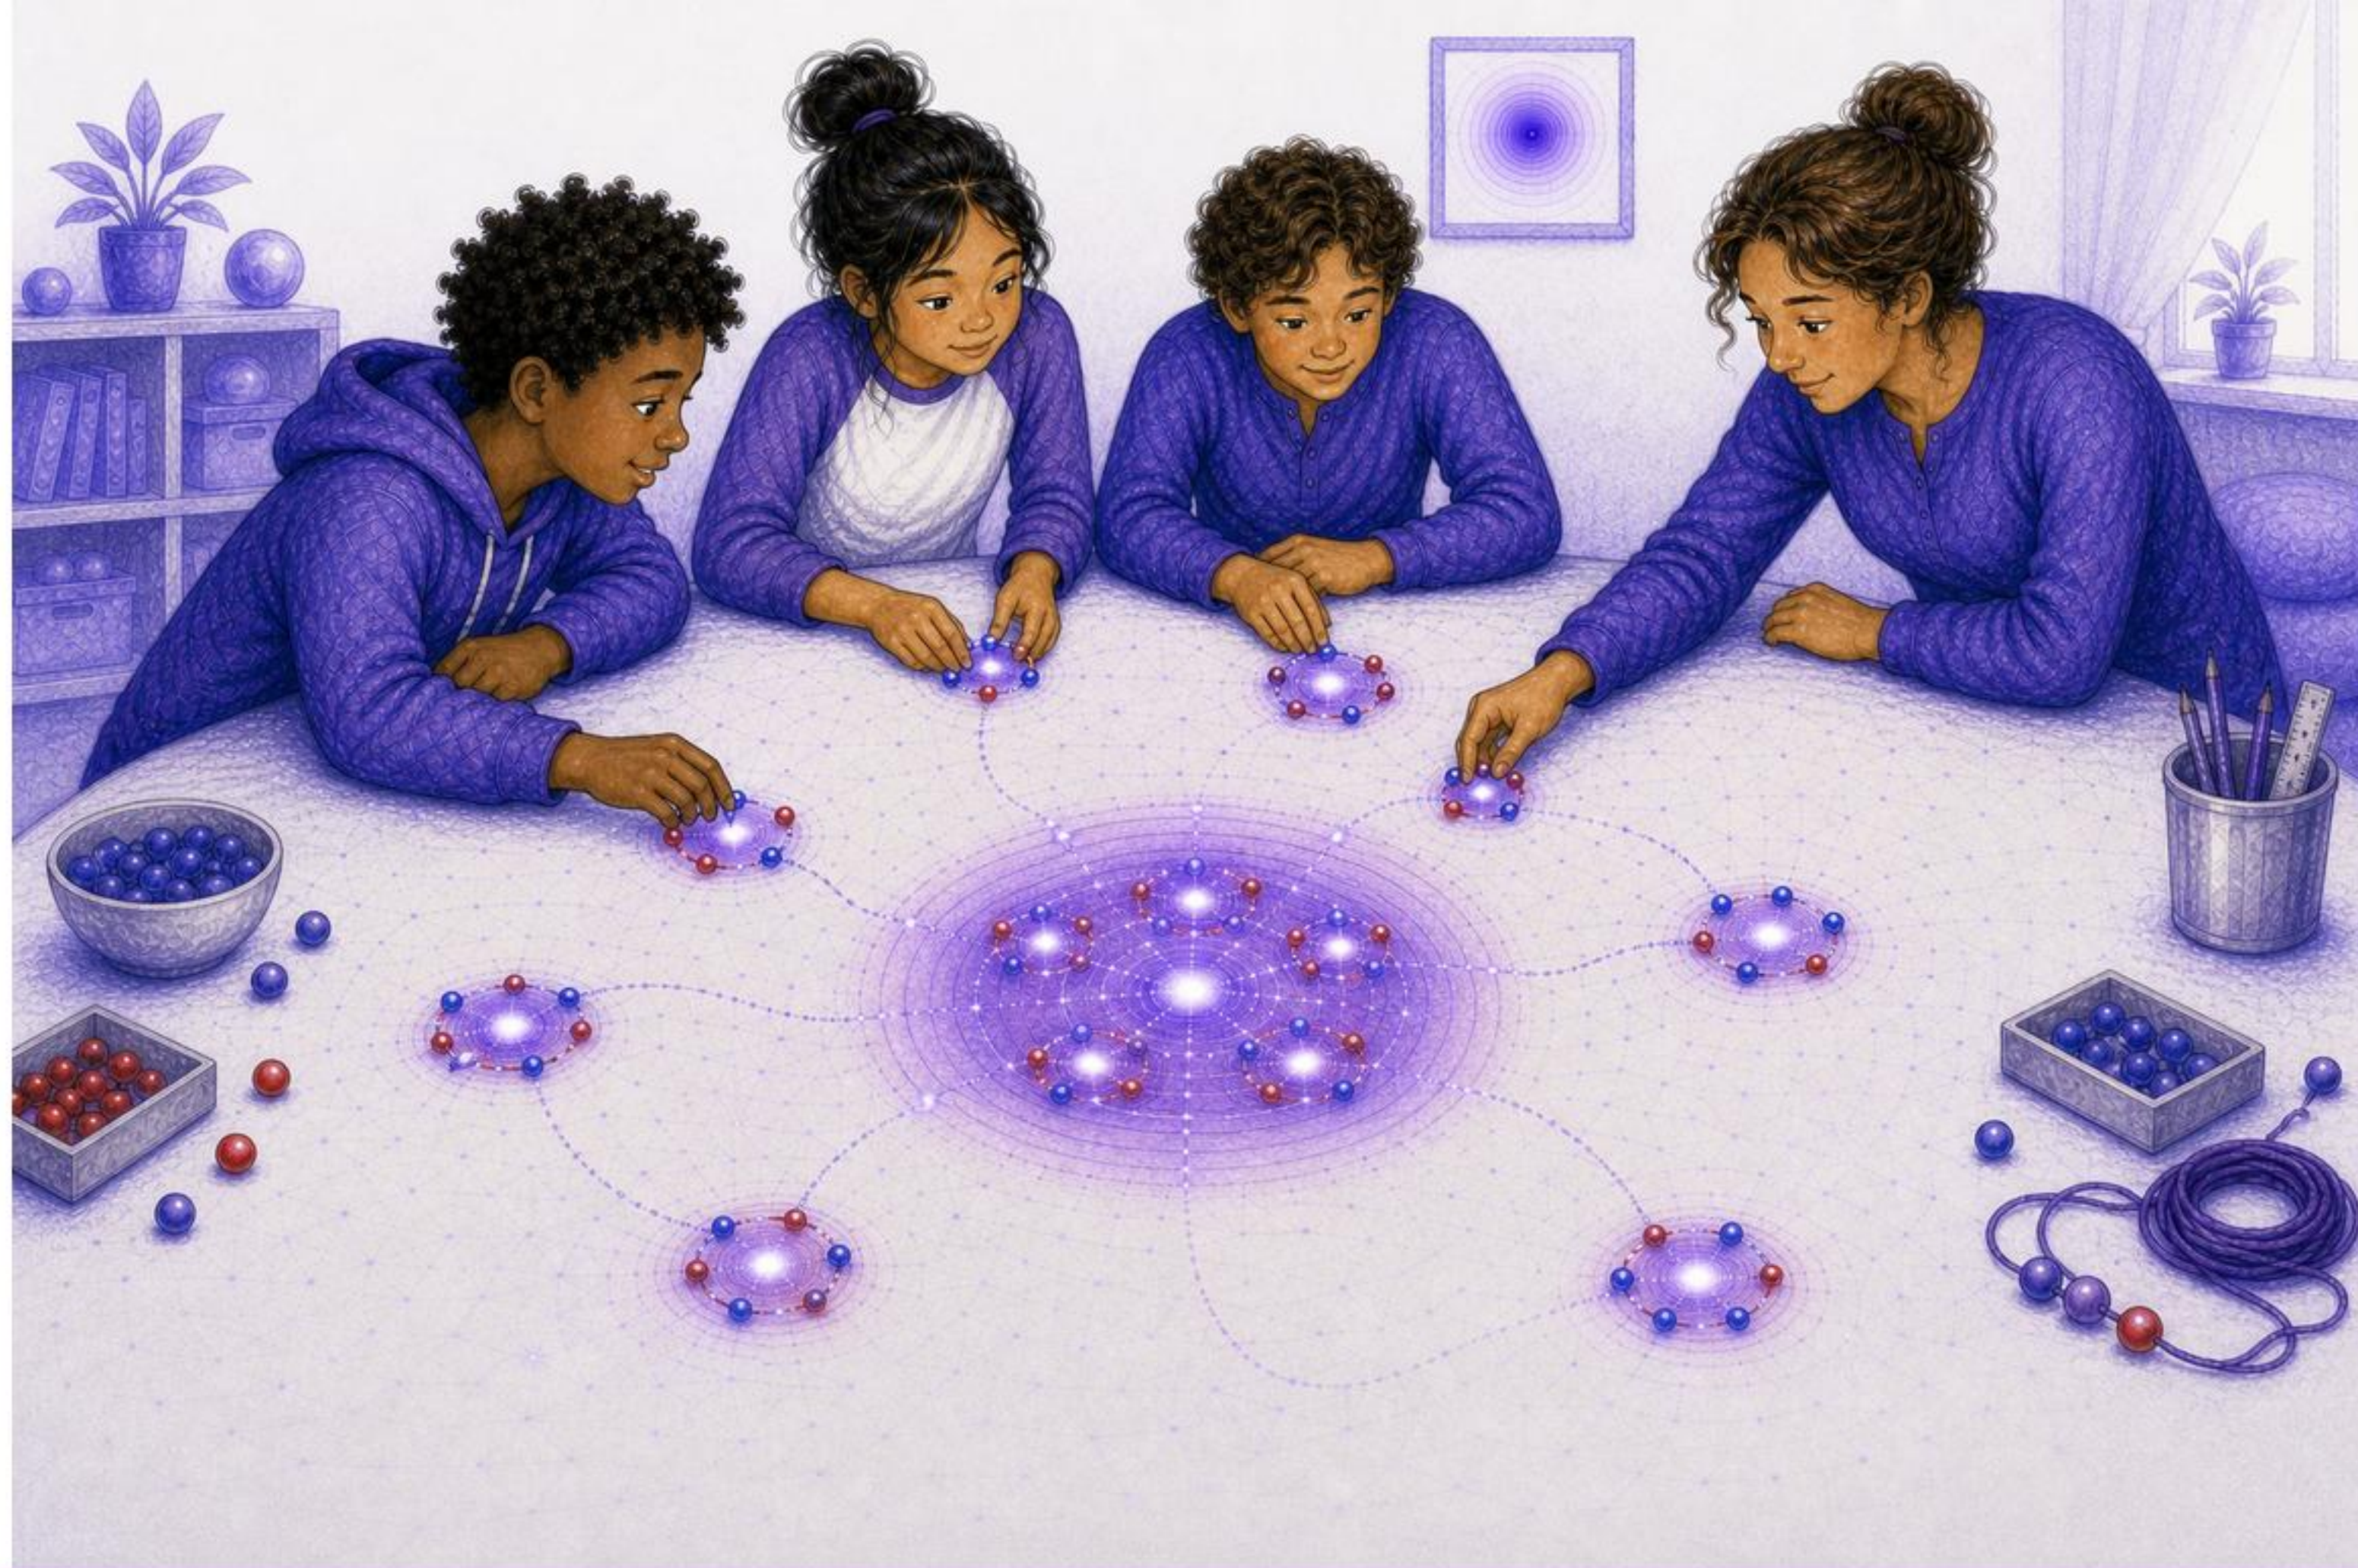

Noether sea response is the medium context for recovered observer-level behavior.

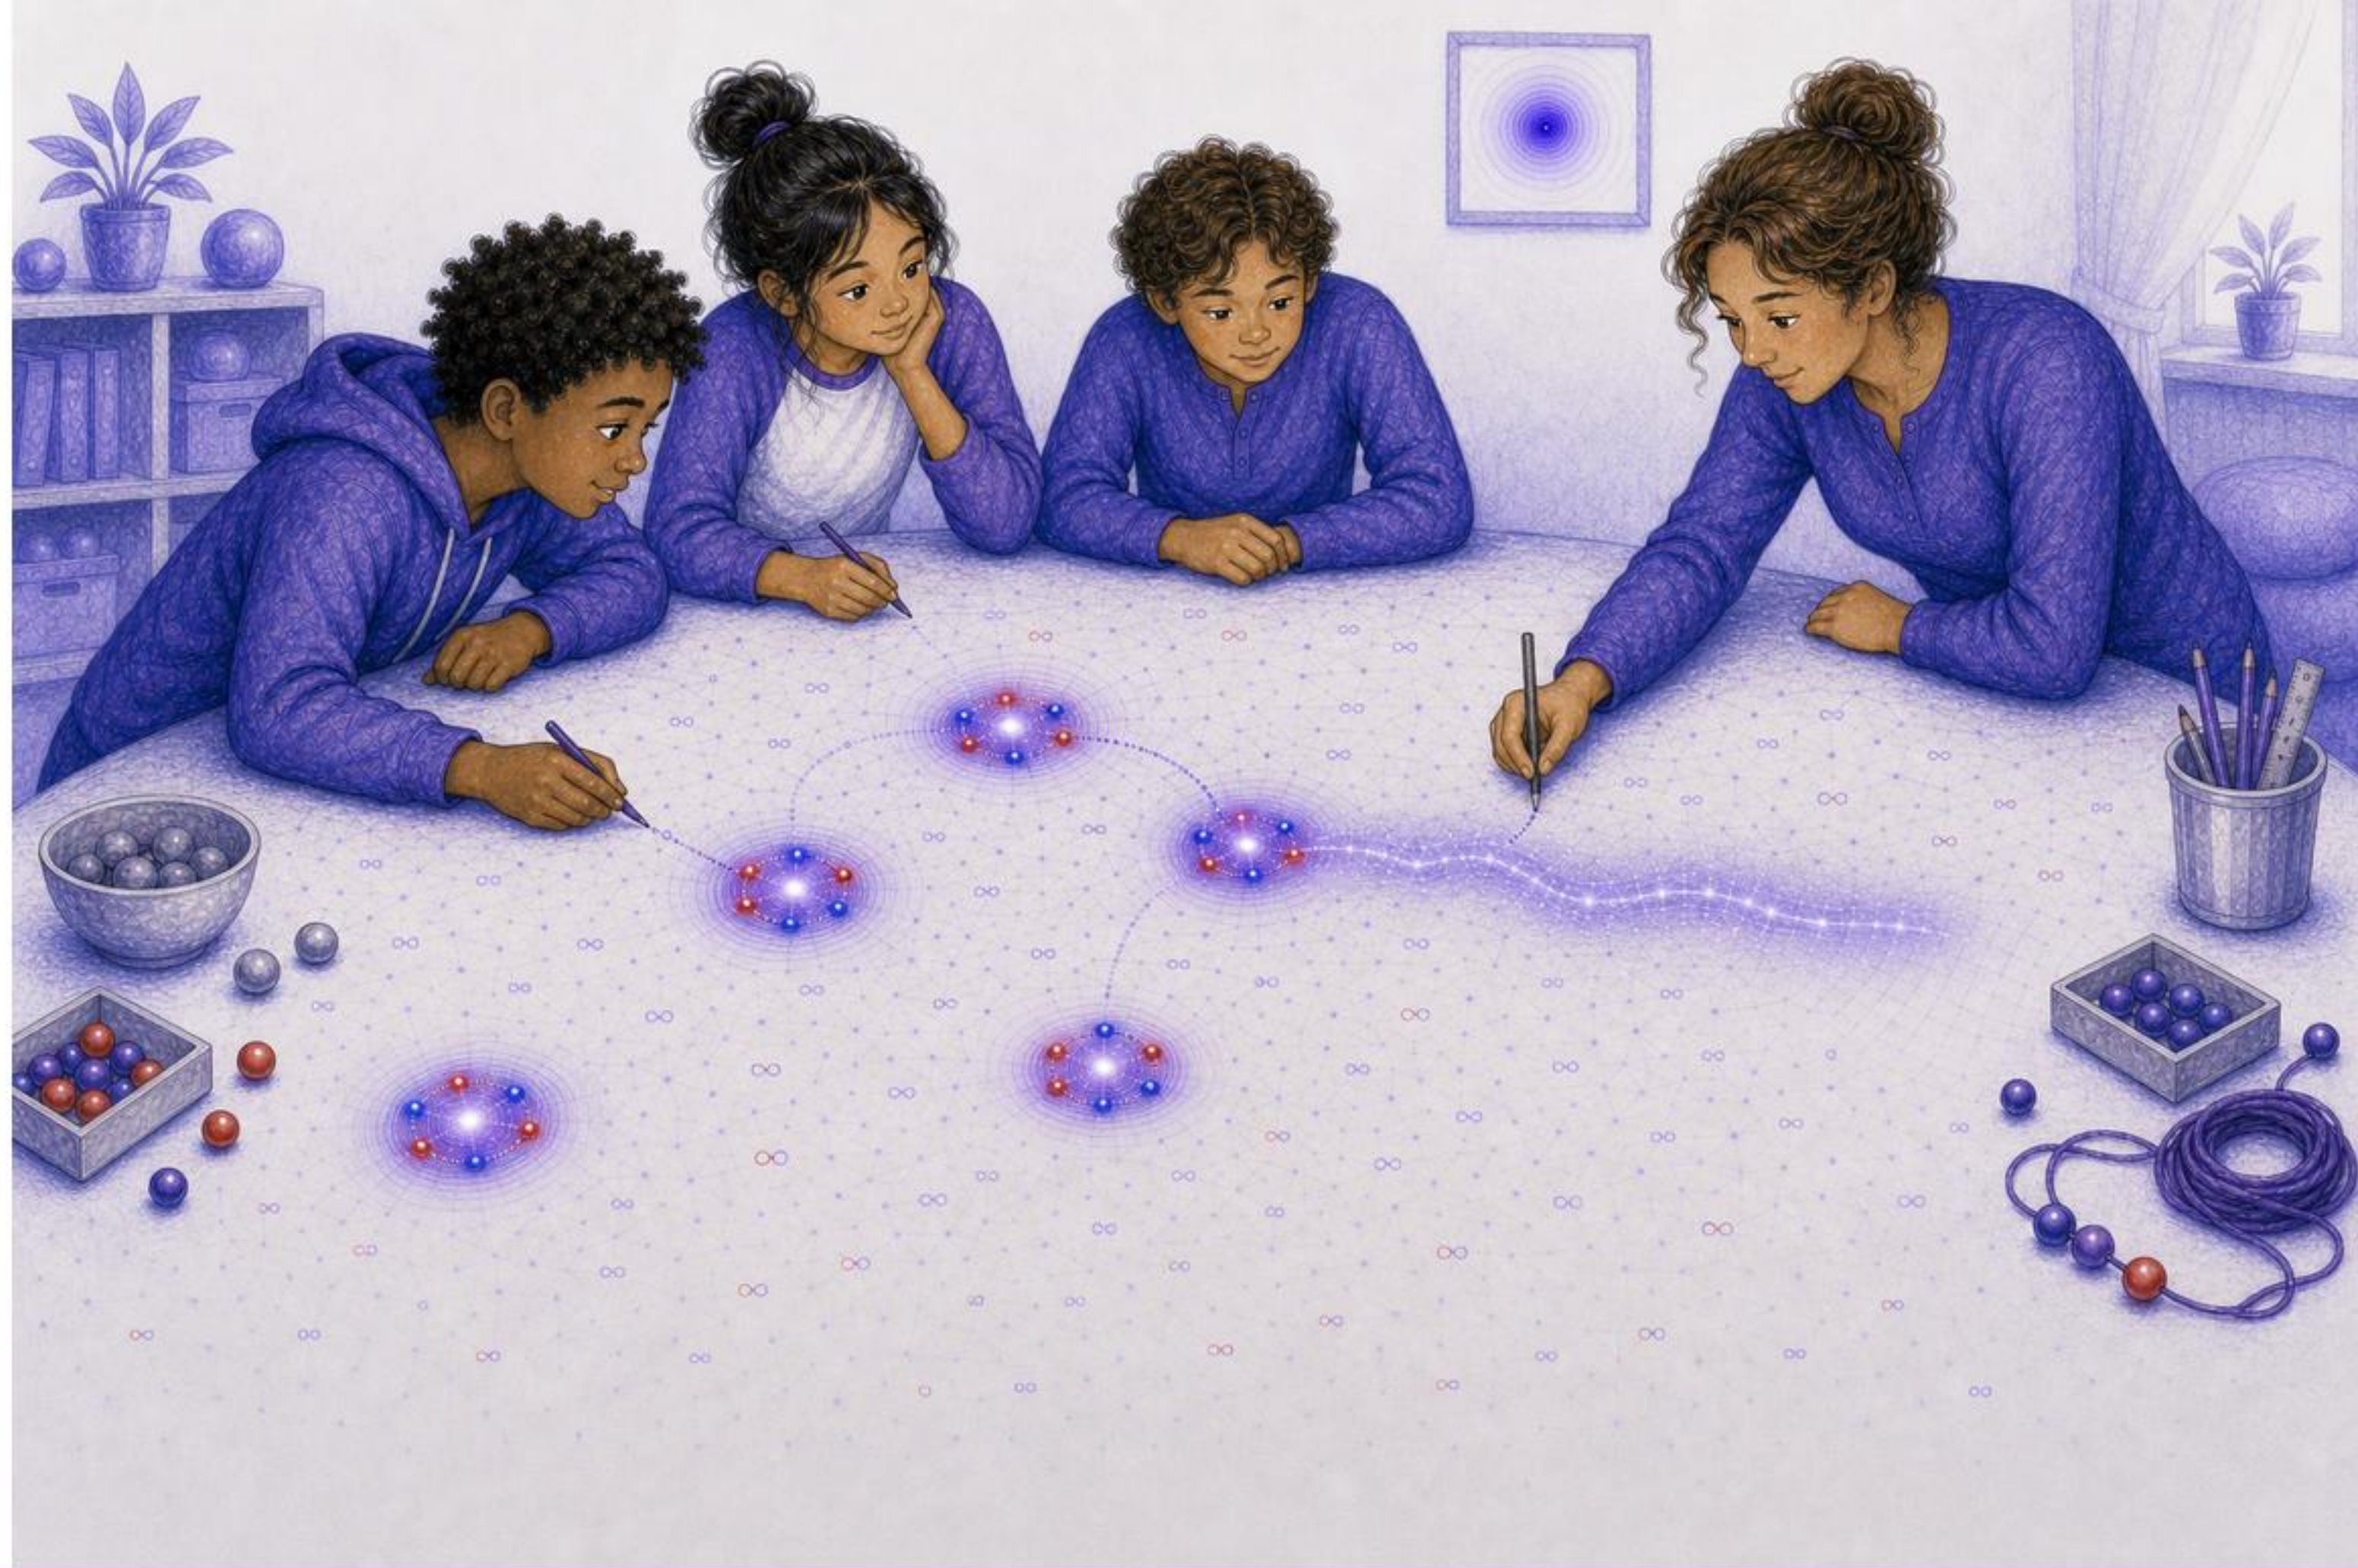

Recovery claims must be separated by level: observed, simulated, derived, and open.

Build red/blue point assemblies with beads or tokens.

Nest small assemblies into larger structures.

Draw a quiet medium around them.
