

The Tiny Transceivers

Electra and Poz opened the message lab.
Their question was small and enormous:
What sends the deepest messages?

Electra placed one red point on the screen.
It moved.
They could follow its path.

Then Poz placed one blue point.
"This is the other kind,"
Poz said.

A card on the screen said:
architrino.
Electra read the word slowly.

The red architrino moved.
From its old place, a message began.

The blue architrino crossed the screen.
When the message reached it,
its path changed.

"It is not just a flash,"
Poz said.
"It has a before and after."

Red and blue did not answer the same way.
Their paths bent differently.

One pair bent inward.
The children called it toward.

Another pair bent outward.
The children called it away.

"Red is not angry,"
Electra said.
"Blue is not calm."

The lab filled with red and blue points.
Every one kept its own path.

Each tiny point could send.
Each tiny point could receive.
The room became a web of messages.

"Tiny does not mean simple,"
Poz said.
"Tiny can carry the rules."

Path.
Send.
Receive.

Path.
Send.
Receive.
